MULLARD LIMITED

MULLARD HOUSE, TORRINGTON PLACE, LONDON W.C.1

TELEPHONE: LANGHAM 6633

1. GENERAL

Failure to observe these General Operational Recommendations may seriously reduce the life of a valve and in some instances could result in catastrophic failure.

Any enquiries should be addressed to the Government and Industrial Valve Division, Mullard Limited.

2. CHARACTERISTICS

The published characteristics are based upon averages of readings taken on a representative number of valves.

3. LIMITING VALUES

The limiting values whether maximum or minimum are absolute and the following definition of the absolute system has been based on that agreed by the International Electrotechnical Commission.

3.1. Absolute-maximum rating system

Absolute-maximum ratings are limiting values of operating and environmental conditions applicable to any valve of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the valve manufacturer to provide acceptable serviceability of the valve, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the valve under consideration and all other electron devices in the equipment.

The equipment manufacturer should design so that initially and throughout life no absolute-maximum value for the intended service is exceeded with any valve under the worst probable operating conditions with respect to supply voltage variations, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the valve under consideration and of all other devices in the equipment.

In some instances, such as with very short pulse durations or complex wave trains, it may be permitted to exceed the absolute values, but the desired operating conditions must be agreed with Mullard Limited.

4. TYPICAL OPERATING CONDITIONS

Typical operating conditions are given, some of which may incorporate one or more of the absolute ratings; in such cases the designer should take precautionary steps to ensure that these ratings are never exceeded.

Where several typical operating conditions are given, interpolation for intermediate conditions is generally permitted. There are exceptions to this rule and the operating conditions should be agreed with Mullard Limited.

5. INSTALLATION

Ferrous tools must not be used on permanent magnet valves, as this may cause deterioration in the performance of the valve. Any glass or ceramic insulation supporting the cathode terminal should be carefully cleaned when necessary since pulse current leakage could cause irregular transmission and damage through local heating. In addition the outlet flange must be clean in order to discourage arcing.

6. PRESENTATION OF VALVE DATA

The symbols, component and base references incorporated in the data are in accordance with the following British Standards:—

1409: 1950	Letter symbols for electronic valves.
1991: Part I: 1954	Letter symbols, signs and abbreviations.
530: 1948 (with supplements)	Graphical symbols for telecommunications.
448: 1953	Electronic-valve bases, caps and holders.
204: 1960	Glossary of terms used in telecommunications (including radio) and electronics.

COMMUNICATIONS MAGNETRONS

The following recommendations should be interpreted in conjunction with British Standard Code of Practice No. CP1005: 'The Use of Electronic Valves', Part 9, upon which these notes have, in part, been based.

1. HEATER

1.1. General

A cathode temperature either too high or low may lead to unsatisfactory operation such as moding and arcing, involving short life and loss of efficiency.

During operation the cathode temperature is increased by electron bombardment ('back heating'). The data sheets for magnetrons, therefore, usually contain information relating the heater voltage to the average anode input power so that the cathode temperature can be maintained at the desired level.

The heater voltage should be at the stated nominal when the h.t. is first applied, and be subsequently reduced as recommended in the data. In the case of magnetrons having cathodes of small thermal capacity, it may be necessary to reduce the heater voltage immediately the anode voltage is applied.

With some valves it may be required to limit the filament or heater current when switching on the supply. Information on this will generally be included on individual data sheets.

1.2. Indirectly heated oxide-coated cathodes

To obtain maximum life the heater voltage must be within $\pm 5\%$ of the value recommended for a particular operation.

1.3. Directly heated cathodes

Reference should be made to the individual data sheets.

2. INPUT AND OUTPUT CONNECTIONS

2.1. Input connection

The negative input voltage should be applied to the common heater-cathode terminal to avoid the flow of anode current through the heater which might be damaged.

In applications where a bifilar pulse transformer is used a non-inductive capacitor should be connected between the heater-cathode and heater terminals to suppress any high transient voltages.

2.2. Output connection

It is important that the type of output connection should be as specified in the data. Use of flat coupling instead of choke coupling or vice versa may upset the matching and possibly cause breakdown of the output system. Connections to the output must be designed to be sufficiently tight to avoid arcing and other faults. It is also important to avoid undue stressing of the output section which would either deform the metal or break the glass or ceramic vacuum seals. It is, therefore, necessary that any mechanical pressure be applied uniformly.

GENERAL OPERATIONAL RECOMMENDATIONS

MICROWAVE DEVICES: RADAR AND COMMUNICATION MAGNETRONS

3. H.T. SUPPLY AND MODULATORS

3.1. General

The dynamic impedance of magnetrons is in general low; thus small variations in the applied voltage can cause appreciable changes in operating current. In the equipment design it is necessary to ensure that such variations in operating current do not lead to operation outside the published limits.

Current changes result in variation of power frequency and frequency spectrum quality and consequent deterioration of equipment performance. This factor should determine the maximum current change inherent in the equipment design under the worst operating conditions.

3.2. C.W. types

For c.w. types the amount of smoothing required in the h.t. supply depends on the amount of modulation, resulting from operating current variation, which can be tolerated.

Under certain operational conditions a c.w. magnetron can develop a negative resistance characteristic and a minimum value of series resistance which should be adjacent to the magnetron is given in individual data sheets.

3.3. Pulse types

To ensure a constant operating condition with a pulsed valve the modulator design must provide a pulse, the amplitude of which does not vary to any significant extent from pulse to pulse. The necessary design precautions depend on the type of modulator employed, and cannot be generalised.

The performance of a magnetron is often a sensitive function of the shape of the pulse that it receives and it is necessary to control four distinct aspects: rate of rise, spike, flat and rate of fall. In this connection it is important that any observation of the shape of the pulse, either of voltage or of current, supplied by the modulator should be made with a magnetron load and not with a dummy load, because a magnetron acts as a non-linear impedance. Furthermore, a magnetron is likely to be more sensitive to a mismatched load.

3.3.1. Rate of rise

Both maximum and minimum rates of rise of voltage (and sometimes current) may be specified. The most critical value is that just before and during the initiation of oscillation. Too high or low a rate of rise may accentuate the tendency to moding.

Too high a rate of rise may cause operation in the wrong mode or even failure to oscillate, and either of these conditions may lead to arcing due to overheating or to excessive voltages.

Operation at too low a rate of rise may also cause oscillation in the wrong mode or oscillation in the normal mode for an appreciable period at less than full current and this will cause frequency pushing leading to a broad frequency spectrum.

The rate of rise of voltage should be measured above the 80% point of the peak voltage corresponding to the onset of oscillation. For accuracy it is advisable to measure the rate of rise by means of a differentiating circuit whose total capacitance does not exceed 5% of the total stray capacitance of the modulator output circuit. Direct observation on an oscilloscope can be misleading due to the limitation of the oscilloscope and sampling device.

3.3.2. Spike

It is important that the voltage pulse should not have a high spike on the leading edge. Such a spike may cause the valve to start in an undesired mode. Although this operation may not be sustained, the transient condition may lead to destructive arcing. Measures taken to reduce the spike must not also reduce the rate of rise below the specified minimum.

3.3.3. Flat

The top of the voltage pulse should be free from ripple or droop since small changes in voltage cause large current variations resulting in frequency pushing. This leads to frequency modulation of the r.f. pulse and consequent broadening of the spectrum or instability.

3.3.4. Rate of fall

The fall of voltage must be rapid at least to the point where oscillation ceases, to avoid appreciable periods of operation below full current, with the attendant frequency pushing. This point is normally reached when the voltage has fallen to about 80% of the peak value.

Beyond this point a lower rate of fall is generally permissible, but a significant amount of noise will be generated, which may be detrimental to radar systems with a very short minimum range. To prevent coherent noise being generated especially in short range radars the voltage tail must decay to zero before the radar receiver recovers.

A fast rate of fall is also important where valves are operated at a high pulse recurrence frequency since any diode current which occurs after oscillations have ceased will add appreciably to the mean current and dissipation of the valve.

In certain applications it is desirable to return the valve cathode to a positive d.c. bias in order to speed up the rate of fall and to prevent diode current being passed during the inter-pulse period.

4. LOADING

The anode current range shown in individual data sheets is related to a maximum standing wave ratio seen by the magnetron of 1.5 to 1. Incorrect loading beyond this may reduce the current range for stable operation and can cause arcing or moding.

5. GENERATOR LOAD CHART (Rieke diagram)

A chart showing typical output power and frequency change plotted on a modified impedance circle diagram against magnitude (v.s.w.r.) and phase of the load seen by the magnetron, provides information on the behaviour of the magnetron to different load conditions.

Such a chart is often referred to as a Rieke diagram.

6. PHASE OF SINK

From the generator load chart it is seen that with a load of bad mismatch and at a particular phase, there is a region on the chart which is characterised by high power output and convergence of the frequency contours. This region is known as 'the sink' and the phase of the load at which the

magnetron behaves in this manner is known as 'the phase of sink'. Operation of the magnetron under this load condition will lead to instability and may cause failure of the magnetron. By matching the r.f. system such that the maximum permitted load v.s.w.r. is not exceeded, the sink will be avoided.

7. OPERATION IN DUPLEXER SYSTEMS

7.1. Position of t.r. cell

Where the r.f. systems incorporates a t.r. cell a bad load mismatch, which is unavoidable, is seen by the magnetron momentarily until the cell has been ionised. If the phase of this mismatch is such that it is in the phase of sink the build up of oscillation of the magnetron may be prevented. It is therefore essential that the t.r. cell is so positioned that its phase of mismatch as seen by the magnetron is remote from the sink region.

7.2. Position of minimum

In the non-oscillating condition the magnetron presents at its frequency of oscillation a bad mismatch of considerable magnitude to the r.f. system. This property is utilised in certain duplexer systems. In the design of such a system it is necessary to know the phase of the above load mismatch and this is designated at a position of minimum of the voltage standing wave in relation to a reference plane on the magnetron output system.

8. COOLING

8.1. General

The maximum temperature of the anode block, cathode terminal assembly and waveguide windows, where applicable, should on no account be exceeded. It may be necessary to provide additional cooling to prevent these temperature limits being exceeded. Where air or water cooling is necessary, interlock switches should be provided to prevent operation in the event of failure or reduction of cooling medium. In the development stage of an equipment the various temperatures should be measured with due regard to the ultimate environmental conditions. Special paints and lacquers are available for this purpose but any other suitable means may be used.

8.2. Air cooling

For the cooling of components such as input waveguide windows and output domes it is important that the air should not contain dust, moisture or grease.

8.3. Water cooling

The circulating cooling water should be as free as possible from all solid matter and the dissolved oxygen content should be low. Whenever possible a closed water system using distilled or demineralised water should be employed.

9. PRESSURISATION

The limiting values and operating conditions quoted in the data are given for a pressure of 650mm of mercury unless otherwise stated. In the case of high power magnetrons it may be necessary to pressurise the output waveguide in order to prevent electrical breakdown. Advice is given in the individual valve data sheets. Precautionary steps should be taken to prevent operation in the event of the failure of the pressurisation. In order to avoid dielectric breakdown, clean and dry air or gas must be used.

10. STORAGE

Valves should be stored in their original packing because this has been designed to protect the valve against reasonable vibration, and knocks. It also ensures that the spacing between permanent-magnet valves and other magnets or ferrous objects is adequate to avoid reduction of magnetisation. Despite this controlled spacing, magnetically-sensitive instruments such as compasses, electrical meters and watches should not be brought close to a bank of packaged magnetrons.

When a valve is protected by a moisture-proof container this fact is clearly stated on the outside. Unnecessary opening of the seal should be avoided so that the dessicant is not exhausted rapidly. When a magnetron is temporarily taken out of service it should be placed immediately in its proper container. This is a good practice which obviates the risk of damage to the magnet or to the glass or ceramic parts and prevents the entry of foreign matter into the output aperture.

Unpacked permanent-magnet valves should **NEVER** be placed on steel benches or shelves.

11. CONDITIONING

It is recommended that after transit or a long period of storage the anode voltage should be increased gradually or in several steps until normal operation is achieved. This treatment will clean up any traces of gases which could cause arcing or instability and this procedure is particularly important in high power magnetrons.

12. RADIATION HAZARDS

In general the shorter the wavelength of an r.f. radiation the greater the absorption by body tissues and hence for comparable power, the greater the hazard. With magnetrons the power may be sufficient to cause danger, particularly to the eyes.

If it is necessary to look directly into a magnetron output, this should be performed through an attenuating tube or through a small hole set in the wall of the waveguide at a bend. Alternatively r.f. screening such as copper gauze of mesh small compared with the wavelength must be provided.

With high power magnetrons precautions may also be necessary to reduce the stray r.f. radiation emitted through the cathode stem and other apertures, especially when the magnetron is functioning incorrectly.

High voltage magnetrons (as well as the high voltage rectifier and pulse modulator valves) can emit a significant intensity of X-rays and protection of the operator may be necessary. When magnetron behaviour is viewed through an aperture X-rays may be present. Protection of the eye is afforded by viewing through lead glass.

TUNABLE MAGNETRON

JNT1-500

Frequency: 'L' band, mechanically tunable.
 Power output: 600kW, pulsed.
 Construction: Unpackaged, forced-air cooled.

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS—MICROWAVE DEVICES: INTRODUCTION and RADAR AND COMMUNICATION MAGNETRONS which precede this section of the handbook.

CHARACTERISTICS

	Min.	Max.	
Frequency			
Tunable over the range	1.22	to 1.35	Gc/s
Pulse voltage			
($I_{pulse} = 46A$, $H = 1.4kG$)	26.5	31.5	kV
R.F. pulse power output	400	—	kW
($I_{pulse} = 46A$, $H = 1.4kG$)			
Frequency pulling factor	—	5.0	Mc/s
(v.s.w.r. = 1.5)			
Frequency pushing factor	—	60	kc/s per A
Frequency temperature coefficient	—	-30	kc/s per °C

CATHODE

Indirectly heated

V_h	23.5	V
I_h	2.2	A
$I_{heating}$, max.	4.0	A

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 3 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 5 minutes. It is necessary to reduce the heater voltage immediately after the application of h.t. and if operation substantially different from that shown under typical operation is envisaged Mullard Ltd. should be consulted.

TYPICAL OPERATION

f	1.285	Gc/s
Heater voltage (running)	15.5	V
Pulse duration	1.0	μs
Pulse repetition frequency	1000	p/s
Duty cycle	0.001	
Pulse current	46	A
Pulse voltage	27.2	kV
Pulse input power	1.25	MW
R.F. pulse output power	610	kW
Mean input current	46	mA
Mean input power	1.25	kW
Mean r.f. output power	610	W
Frequency pulling (v.s.w.r. = 1.5)	4.0	Mc/s
Rate of rise of pulse voltage	60	kV/μs
Magnetic field strength	1.4	kG

OPERATING NOTES

1. The magnetron is designed to feed into a 50Ω, 1½ inch coaxial transmission line.
2. The maximum torque to be applied to the driving gear wheel for tuning the magnetron should not exceed 8lb. in (9.2kg.cm).
3. The coaxial outlet should be protected by a dust cover when the magnetron is not in use.

COOLING

It is necessary to direct a flow of cooling air between the radiator fins, and on the cathode and heater seals, in order to keep the temperature below the permitted maximum.

LIMITING VALUES (absolute ratings)

	Min.	Max.	
Pulse current	25	60	A
Pulse voltage	24	34	kV
Pulse duration	1.0	6.0	μs
Duty cycle	—	0.002	
Mean input power	—	1.8	kW
Rate of rise of voltage pulse			
$t_p \leq 1.0\mu s$	—	70	kV/μs
$1.0 \leq t_p \leq 5.0\mu s$	—	30	kV/μs
Load mismatch (v.s.w.r.)	—	1.5	
Temperature of anode block	—	125	°C

MOUNTING POSITION

Any

PRESSURISING

The output system may be pressurised up to a pressure of 1550 torr.

 I_h

Heating time

At ambient temperatures above 0°C the cathode must be heated for at least 2 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 3 minutes.

RATINGS (ABSOLUTE MAXIMUM SYSTEM)

	Min.	Max.	
Operating current (unmodulated c.w.)	20	60	mA
Peak operating current (modulated c.w.)	-	100	mA
Mean input power	-	60	W
Load mismatch (v.s.w.r.)	-	1.5	
Temperature of anode block	-	140	°C

OPERATING NOTE

A limiting resistor of $1\text{k}\Omega$ should be inserted in series with the magnetron.

END OF LIFE PERFORMANCE

The valve is deemed to have reached end of life when it fails to satisfy the following:-

R.F. power output ($\emptyset = 50\text{mA}$)	Min.	Max.	W	
Frequency				
Within the band	9,345	to	9,405	GeV/s
Operating voltage ($\emptyset = 50\text{mA}$)	0.9	to	1.1	kV

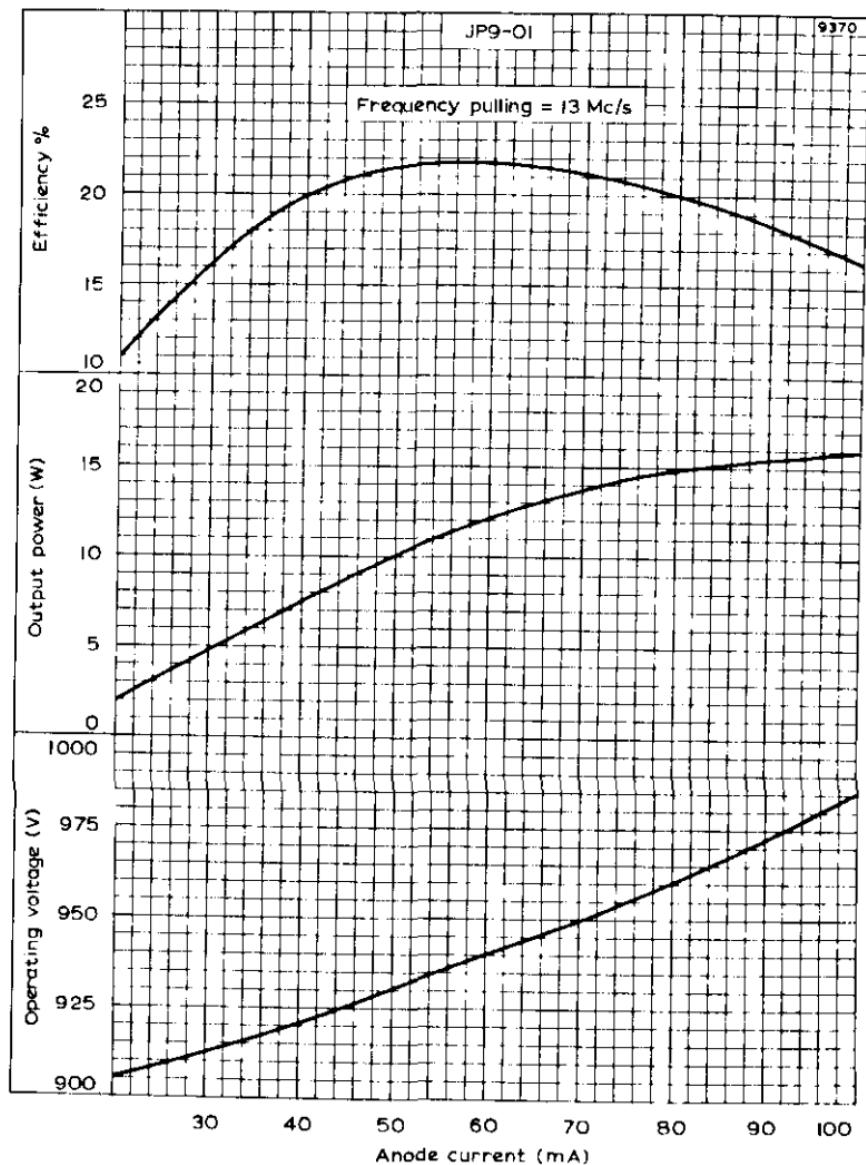

MOUNTING POSITION	Any

MAGNETRON

CATHODE

Indirectly heated

V_h	6.3	V
I_h	550	mA

Heating time. At ambient temperatures above 0°C, the cathode must be heated for at least 2 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 3 minutes. In many applications involving short pulse lengths and high pulse repetition frequencies the mean current which would be calculated from the duty cycle is increased by a pre-oscillation current. For mean input powers greater than 25 watts, it is necessary to reduce the heater voltage immediately after the application of h.t. in accordance with the input power heater voltage rating chart on page C3.

CHARACTERISTICS

Frequency		Min.	Max.	
Fixed within the band	JP9-15	9.345 to	9.405	Gc/s
	JP9-15B	9.415 to	9.475	Gc/s
Pulse voltage ($I_{pulse} = 7.5A$)		7.0	8.2	kV
R.F. pulse power output ($I_{pulse} = 7.5A$)		17	—	kW
Frequency pulling factor (v.s.w.r. = 1.5)		—	18	Mc/s
Frequency pushing factor		—	1.5	Mc/s per A
Frequency temperature coefficient		—	-250	kc/s per °C
Distance of v.s.w. minimum from face of mounting plate into valve		16.5	22.5	mm
Input capacitance		—	8.0	pF

END OF LIFE PERFORMANCE

R.F. pulse power output ($I_{pulse} = 7.5A$)		15	kW
Frequency		Min.	Max.
Within the band	JP9-15	9.345 to	9.405
	JP9-15B	9.415 to	9.475
Pulse voltage ($I_{pulse} = 7.5A$)		7.0	8.2

COOLING

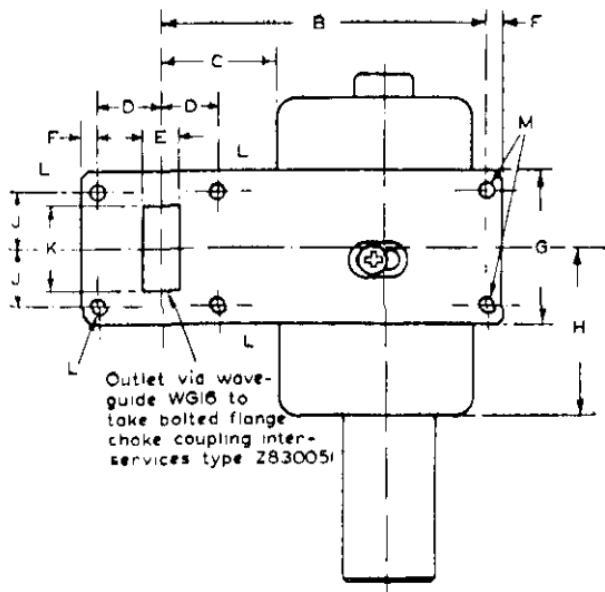

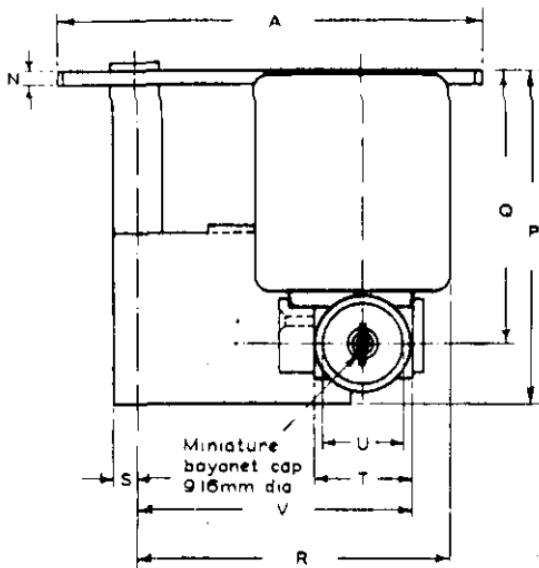

In normal circumstances natural cooling is adequate, but where the ambient temperature is abnormally high, a flow of cooling air between the radiator fins may be necessary to keep the block temperature below the permitted maximum.

Pulse current	7.0	10.	A
Pulse duration	-	2.5	μs
Duty factor	-	0.0015	
Mean input power	-	83	W
Rate of rise of voltage pulse	-	100	kV/ μs
Load mismatch (v.s.w.r.)	-	1.5	

CATHODE

Indirectly heated

V_h	6.3	V
I_h	0.55	A
I_h (surge) max.	5.0	A
r_h (cold)	1.75	Ω

Heating time

At ambient temperatures above 0°C the cathode must be heated for at least 2 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 3 minutes.

In many applications involving short pulse lengths and high pulse repetition frequencies the mean current which would be calculated from the duty cycle is increased by a pre-oscillation current.

For mean input powers greater than 25watts, it is necessary to reduce the heater voltage immediately after the application of h.t. in accordance with the input power-heater voltage rating chart on page C1.

END OF LIFE PERFORMANCE

The valve is deemed to have reached end of life when it fails to satisfy the following:

R. F. pulse power output ($I_{pulse} = 8.6A$) 17 kW

Min. Max.

Frequency within the band 9.38 to 9.44 GHz

Pulse voltage ($I_{pulse} = 8.6A$) 7.0 to 7.5 kV

THE ANODE IS TERMINATED AT THE BASE PLATE.

R.F. PULSE OUTPUT POWER, ANODE PULSE VOLTAGE AND EFFICIENCY
PLOTTED AGAINST ANODE PULSE CURRENT

JP9-80 JP9-80A

MAGNETRON

REDUCTION OF HEATER VOLTAGE PLOTTED AGAINST INPUT POWER

MAGNETRON

Frequency: 'X' band.
 Output power: 180kW, pulsed.
 Construction: Packaged, forced-air cooled.

JP9-180

PRELIMINARY DATA

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES which precede this section of the handbook.

CHARACTERISTICS

	Min.	Max.	
Frequency			
Fixed within the band	9.325	to	9.425
Pulse voltage ($I_{pulse} = 22.5A$)	18	23	Gc/s
R.F. pulse output power ($I_{pulse} = 22.5A$)	150	—	kW
Frequency pulling factor (v.s.w.r. = 1.5)	—	15	Mc/s
Frequency temperature coefficient	—	-250	xc/s per °C

CATHODE

Indirectly heated

V_h	12.6	V
I_h	2.25	A
$I_{heating}$ max.	7.5	A
$I_{threshold}$	0.67	Ω

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 3 minutes before the application of full h.t. Below this temperature the heating time must be increased to at least 4 minutes.

It is necessary to reduce the heater voltage immediately after the application of h.t. in accordance with the input power-heater voltage rating chart on page C2.

TYPICAL OPERATION

Duty cycle	0.0004	
Heater voltage (running)	8.0	V
Pulse duration	1.0	μs
Pulse repetition frequency	400	p/s
Pulse current	22.5	A
Pulse voltage	20.5	kV
Pulse input power	460	kW
R.F. pulse output power	180	kW
Mean input current	9.0	mA
Mean input power	184	W
Mean r.f. output power	72	W
Frequency pulling (v.s.w.r. = 1.5)	13	Mc/s
Rate of rise of pulse voltage	100	kV/μs

COOLING

It is necessary to direct a flow of cooling air between the radiator fins, and on the cathode and heater seals, in order to keep the temperature below the permitted maximum.

LIMITING VALUES (absolute ratings)

	<i>Min.</i>	<i>Max.</i>	
Pulse current	16	25	A
Pulse voltage	17	24	kV
Pulse duration	—	2.0	μs
Duty cycle	—	0.0005	
Mean input power	—	250	W
Rate of rise of voltage pulse	—	110	kV/μs
Load mismatch (v.s.w.r.)	—	1.5	
Temperature of anode block	—	140	°C
Temperature of cathode and heater seals	—	200	°C

MOUNTING POSITION

Any

PRESSURISING

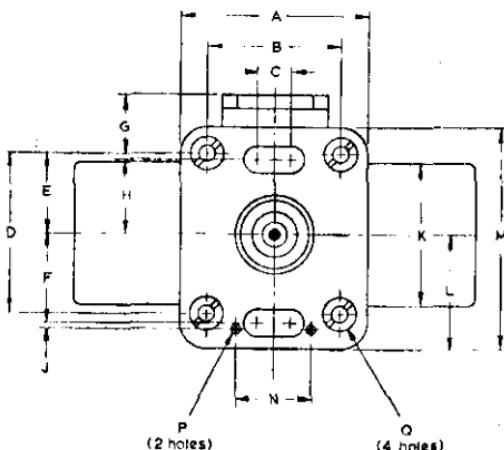

The valve can be operated in the pressure range 600 to 2370mm of mercury.

Cathode terminal assembly

7270

The common heater cathode terminal is the sleeve of the cap, the other heater terminal is the centre contact. The anode connection is terminated at the base plate.

ANODE PULSE VOLTAGE R.F. PULSE OUTPUT POWER AND EFFICIENCY
PLOTTED AGAINST ANODE PULSE CURRENT

Series

HEATER VOLTAGE PLOTTED AGAINST MEAN INPUT POWER

TUNABLE MAGNETRON

Frequency: 'X' band, mechanically tunable.
 Power output: 10W, c.w.
 Construction: Packaged, forced-air cooled.

JPG8-01 **JPG8-01B**
JPT8-01 **JPT8-01B**

The only difference between the JPG8-01 and the JPT8-01 is in the mechanical tuning arrangement (see appropriate outline drawing). The suffix 'B' indicates a frequency variant of the basic type.

PRELIMINARY DATA

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES which precede this section of the handbook.

CHARACTERISTICS

Frequency	Min	Max.	
Tunable over the range			
JPG8-01 JPT8-01	8.6	to	9.15
JPG8-01B JPT8-01B	8.0	to	8.6
Operating voltage ($I = 50\text{mA}$)	0.9		kV
R.F. power output ($I = 50\text{mA}$)	5.0		W
Frequency pulling factor	—	20	Mc/s
Frequency pushing factor	—	1.0	Mc/s per mA
Frequency temperature coefficient	—	-500	kc/s per C

CATHODE

Indirectly heated			
V_h	6.3		V
I_h	1.1		A

Heating time. At ambient temperatures above 0 C the cathode must be heated for at least 2 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 3 minutes.

For mean input powers greater than 20 watts it is necessary to reduce the heater voltage immediately after the application of h.t. in accordance with the input power-heater voltage rating chart on page C1.

TYPICAL OPERATION

	JPG8-01B	JPG8-01	
Frequency	8.3	8.9	Mc/s
Heater voltage (running)	4.5	4.5	V
Operating voltage	1.0	1.0	kV
Operating current	50	50	mA
Input power	50	50	mW
R.F. power output	10.6	10.6	W
Frequency pulling (v.s.w.r. = 1.5)	15	15	Mc/s

OPERATING NOTE

The impedance of the n.t. supply should be greater than 5k Ω . In addition a limiting resistor of 1k Ω should be inserted in series with the magnetron.

COOLING

It is necessary to direct a flow of cooling air between the radiator fins in order to keep the temperature below the permitted maximum.

LIMITING VALUES (absolute ratings)

PLOTTED AGAINST ANODE CURRENT

ANODE PULSE VOLTAGE, R.F. PULSE OUTPUT POWER AND FREQUENCY PULLING FOR JPG9-02 AND JPT9-02 TOGETHER WITH DIAL SETTING FOR JPT9-02 PLOTTED AGAINST FREQUENCY

QUICK REFERENCE DATA

Air-cooled magnetron designed for very short pulse operation

Frequency	34.86	Gc/s
Power output (pulsed)	40	kW
Construction	Packaged	

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS—MICROWAVE DEVICES : INTRODUCTION and RADAR AND COMMUNICATIONS MAGNETRONS which precede this section of the handbook.

TYPICAL OPERATIONS

Heater voltage (running)	4.0	4.0	5.0	V
Pulse duration	0.3	0.1	0.02	μs
Pulse repetition frequency	670	2000	5000	p/s
Duty cycle	0.0002	0.0002	0.0001	
Pulse current	12.5	12.5	7.5	A
Pulse voltage	11.7	11.7	11.1	kV
Pulse input power	146	146	83	kW
R.F. pulse output power	40	40	30	kW
*Mean input current	2.5	2.5	1.55	mA
Mean input power	35	35	20	W
Mean r.f. output power	8.0	8.0	3.0	W
Frequency pulling factor (v.s.w.r. = 1.5)	35	35	35	Mc/s
Rate of rise of pulse voltage	250	250	600	kV/μs

*Includes pre-oscillation current.

ABSOLUTE MAXIMUM RATINGS

*For pulse lengths between 0.05μs and 0.02μs rates of rise between 300kV/μs and 600kV/μs can be tolerated, depending on the operating conditions. Prior reference should be made to Mullard Ltd. in such instances.

CATHODE

Indirectly heated, dispenser type

V_h	5.0	V
I_h (at 5.0V)	3.9	A
I_h (surge) max.	8.0	A
r_h (cold)	0.16	Ω

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 3 minutes before the application of h.t. For mean input powers greater than 20 watts, it is necessary to reduce the heater voltage immediately after the application of h.t.

In many applications involving short pulse lengths and high pulse repetition frequencies the mean current which would be calculated from the duty cycle is increased by the pre-oscillation current.

In determining the heater reduction is it necessary to obtain the mean input power from the measured mean input current \times 12,500. The correct value of nominal heater voltage is given by the curve on page C2.

CHARACTERISTICS

	Min.	Max.	
Frequency			
Fixed within the band	34.51	35.21	Gc/s
Pulse voltage (I pulse = 12.5A)	11.5	13.5	kV
R.F. pulse output power (I pulse = 12.5A)	30	—	kW
Frequency pulling factor (v.s.w.r. = 1.5)	—	50	Mc/s
Frequency pushing factor	—	4.0	Mc/s per A
Frequency temperature coefficient	—	-1.0	Mc/s per °C
Position of phase of sink from face of mounting plate out of valve	0.25	0.4	in
Input capacitance	6.0	—	pF

COOLING

For normal operating conditions, a low velocity air-flow is sufficient to keep within the maximum temperature limits.

MOUNTING POSITION

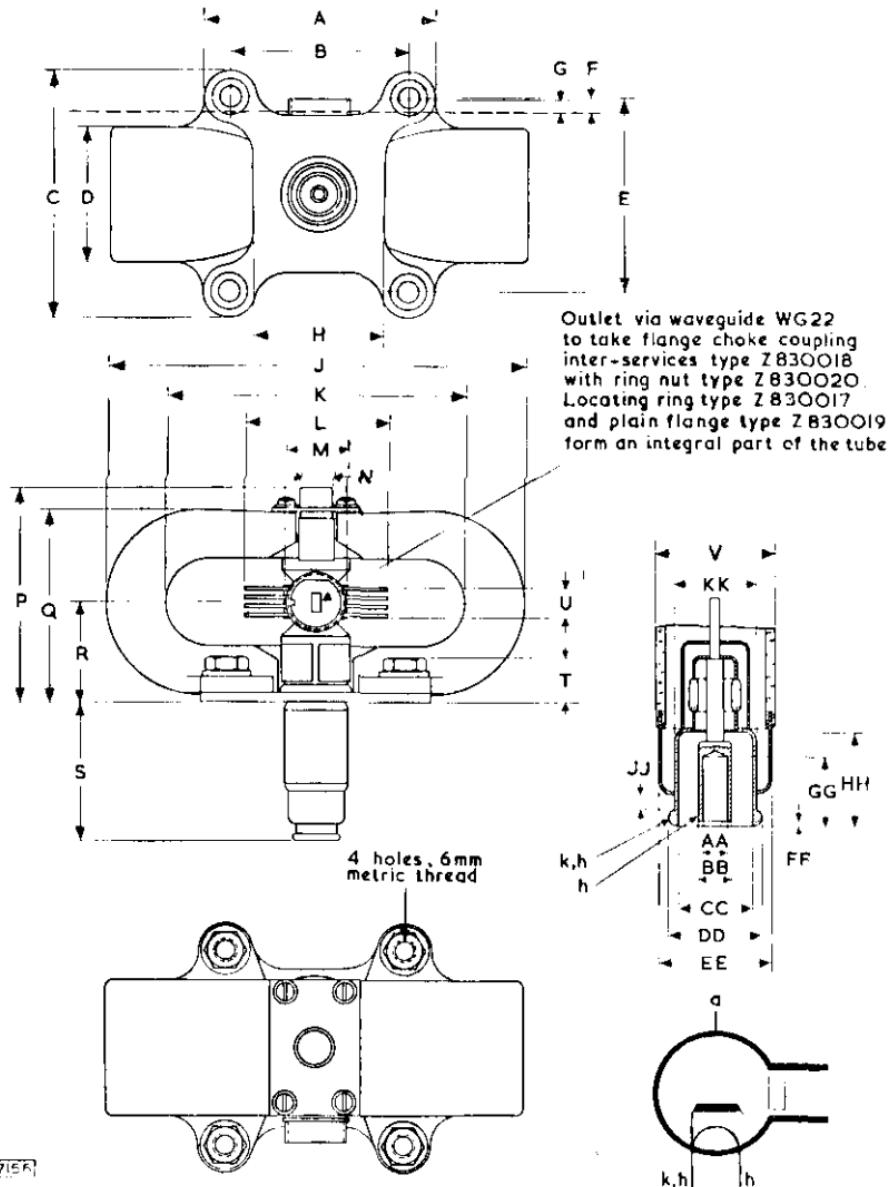

Any

ANODE PULSE VOLTAGE, R.F. PULSE OUTPUT POWER AND EFFICIENCY
PLOTTED AGAINST ANODE PULSE CURRENT

HEATER VOLTAGE PLOTTED AGAINST MEAN INPUT POWER
MEAN INPUT POWER = MEAN INPUT CURRENT \times 12,500

TUNABLE MAGNETRON

Frequency: 'X' band, mechanically tunable.

Power output: 12W, c.w.

Construction: Packaged, forced-air cooled.

JPG8-01 JPG8-01B

JPT8-01 JPT8-01B

The only difference between the JPG8-01 and the JPT8-01 is in the mechanical tuning arrangement (see appropriate outline drawing). The suffix 'B' indicates a frequency variant of the basic type.

PRELIMINARY DATA

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES: INTRODUCTION and RADAR AND COMMUNICATION MAGNETRONS which precede this section of the handbook.

CHARACTERISTICS

Frequency	Min.	Max.	
Tunable over the range			
JPG8-01 JPT8-01	8.6	to	9.15
JPG8-01B JPT8-01B	8.0	to	8.6
Operating voltage ($I = 50\text{mA}$)	0.9		kV
R.F. power output ($I = 50\text{mA}$)	5.0	—	W
Frequency pulling factor	—	20	Mc/s
Frequency pushing factor	—	1.0	Mc/s per mA
Frequency temperature coefficient	—	-0.5	Mc/s per $^{\circ}\text{C}$

CATHODE

Indirectly heated

V_h	6.3	V
I_h	1.2	A

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 2 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 3 minutes.

For mean input powers greater than 20 watts it is necessary to reduce the heater voltage immediately after the application of h.t. in accordance with the input power-heater voltage rating chart on page C1.

TYPICAL OPERATION

	JPG8-01B JPT8-01B	JPG8-01 JPT8-01	
Frequency	8.3	8.9	Gc/s
Heater voltage (running)	4.5	4.5	V
Operating voltage	0.96	0.96	kV
Operating current	50	50	mA
Input power	48	48	W
R.F. power output	11.8	11.8	W
Frequency pulling (v.s.w.r. = 1.5)	15	15	Mc/s

JP8-01 JP8-01B JPT8-01 JPT8-01B

TUNABLE MAGNETRON

OPERATING NOTE

A limiting resistor of $1\text{k}\Omega$ should be inserted in series with the magnetron.

COOLING

It is necessary to direct a flow of cooling air between the radiator fins in order to keep the temperature below the permitted maximum.

ABSOLUTE MAXIMUM RATINGS

	Min.	Max.	
Operating current (unmodulated c.w.)	20	60	mA
Peak operating current (modulated c.w.)	—	100	mA
Operating voltage	0.85	1.15	kV
Mean input power	—	60	W
Load mismatch (v.s.w.r.)	—	1.5	
Temperature of anode block	—	140	°C

MOUNTING POSITION

Any

MECHANICAL CHARACTERISTICS

	Min.	Max.	
Number of turns to cover the tuning range	4	8	
Tuning torque			
JP8-01, JP8-01B		16	oz in
JPT8-01, IPT8-01B		32	oz in
Tuning backlash		5	Mc/s

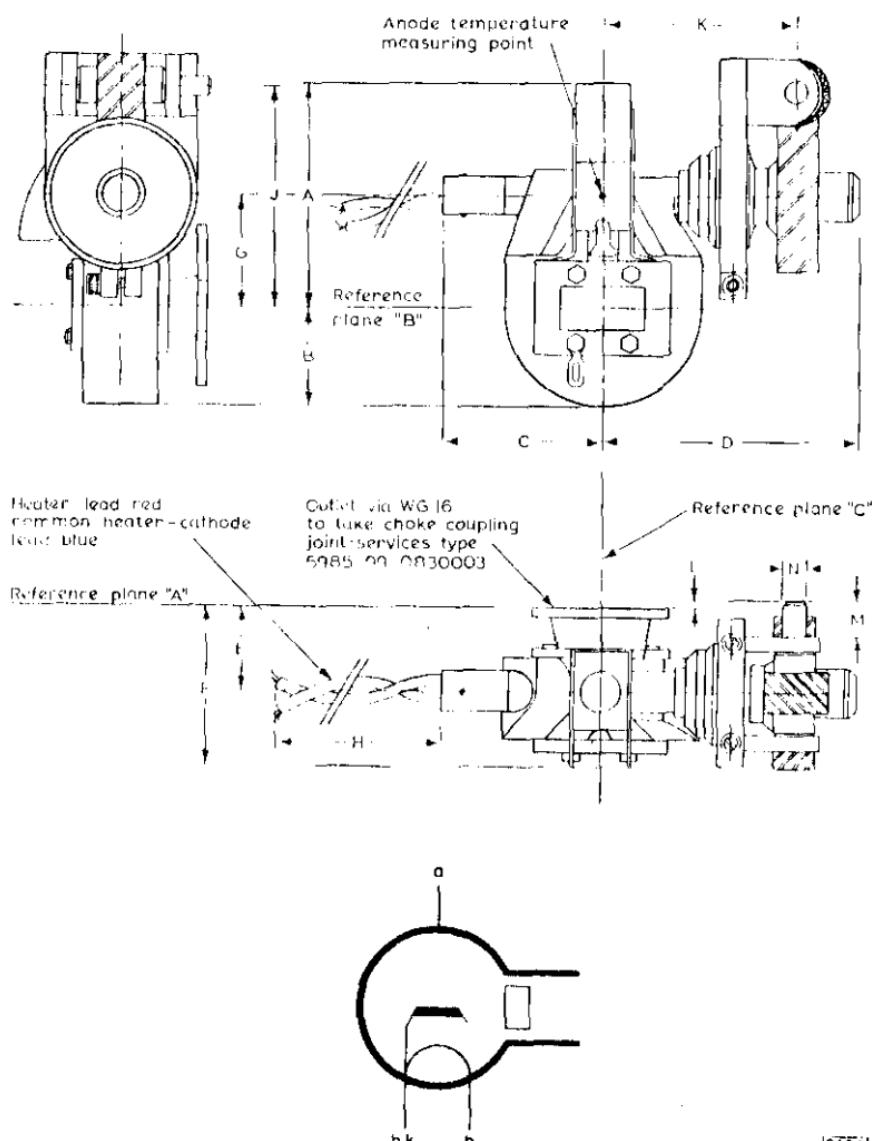

There is no limit to the number of tuning sweeps which may be carried out within the stated frequency range.

The JP8-01 and JP8-01B are intended for motor tuning.

PRELIMINARY DATA

QUICK REFERENCE DATA

Mechanically and electronically tunable c.w. magnetrons.

Frequency	JP8-01E	8.62	Gc/s
	JP9-01B	9.3	Gc/s
Power output		18	W
Construction	Packaged		

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES: INTRODUCTION and RADAR AND COMMUNICATION MAGNETRONS which precede this section of the handbook.

CHARACTERISTICS

		Min.	Max.	
Frequency				
Mechanically tunable over the range				
JP8-01E	8.49	to	8.76	Gc/s
JP9-01B	9.04	to	9.51	Gc/s
Operating voltage ($I = 60\text{mA}$)	910		1090	V
R.F. power output ($I = 60\text{mA}$)	11		—	W
R.F. power output ($I = 30\text{mA}$)	5.0		—	W
Electronic tuning rate (over current range 30mA-90mA)	0.25		1.5	Mc/s per mA
Electronic tuning (over current range 30mA-90mA)	25		—	Mc/s
Frequency temperature coefficient	—		-1.0	Mc/s per C
Input capacitance	—		12	PF

CATHODE Indirectly heated

V_{th}	6.3	V
I_{th}	1.2	A

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 2 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 3 minutes.

TYPICAL OPERATION

Frequency	Midband	
Heater voltage	6.3	
Mean operating current	60	mA
Operating voltage	1.05	kV
Mean input power	63	W
Mean R.F. power output	18	W
Electronic tuning (over current range 30mA to 90mA)	32	Mc/s

ABSOLUTE MAXIMUM RATINGS

	Min.	Max.	
Mean operating current	30	60	mA
Modulated current excursion	30	95	mA
Mean input power	—	66	W
Load mismatch (v.s.w.r.)	—	1.2	
Temperature of anode block	—	140	°C

MECHANICAL CHARACTERISTICS

Tuning torque	16	oz in
Tuning backlash	5.0	Mc/s

The valve may be used with a pressurised system. At 30lb/in² the leakage rate will not exceed 0.0004lb/hr.

PLOTTED AGAINST ANODE CURRENT

ANODE PULSE VOLTAGE, R.F. PULSE OUTPUT POWER AND FREQUENCY PULLING PLOTTED AGAINST FREQUENCY

PRELIMINARY DATA

QUICK REFERENCE DATA

Mechanically tunable pulsed magnetron

Frequency	9.4	Gc/s
Pulsed power output	25	W
Construction	Packaged, low stray radiation, suitable for motor tuning.	

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES: INTRODUCTION and RADAR AND COMMUNICATION MAGNETRONS which precede this section of the handbook.

CHARACTERISTICS

	Min.	Max.	
Frequency Tunable over the range	9.15	to	9.55
Pulse voltage ($I_{pulse} = 140\text{mA}$)	0.95		1.15
R.F. pulse power output ($I_{pulse} = 140\text{mA}$)	18	—	W
Frequency pulling factor (v.s.w.r. = 1.5)	—	20	Mc/s
Frequency pushing factor ($I_{pulse} = 140\text{mA}$)	—		0.2 Mc/s per mA
Frequency temperature coefficient	—		-1.0 Mc/s per °C
Input capacitance	—	12	pF
Peak r.f. leakage power	—	2.5	μW

CATHODE

Indirectly heated

V_h	6.3	V
I_h	1.2	A

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 2 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 3 minutes.

TYPICAL OPERATION

MAGNETRON

Frequency: 'X' band, tunable.

Power output: 60kW, pulsed.

Construction: Packaged, forced-air cooled.

JPT9-60

This data should be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES: INTRODUCTION and RADAR AND COMMUNICATION MAGNETRONS which precede this section of the handbook.

CHARACTERISTICS

	Min.	Max.	
Frequency: Tunable over the range	8.5	to 9.6	Gc's
Pulse voltage ($I_{pulse} = 14A$)	13	15.5	kV
R.F. pulse power output ($I_{pulse} = 14A$)	50	—	kW
Frequency pulling factor (v.s.w.r. > 1.5)	—	18	Mc s
Frequency temperature coefficient	—	-0.25 Mc s per C	
Input capacitance	—	6.0	pF

CATHODE

Indirectly heated

V_h	6.3	V
I_h	1.0	A

Heating time. The cathode must be heated for at least 2 minutes before the application of h.t. The heater voltage must be reduced immediately after the application of h.t. in accordance with the input-power heater-voltage rating chart on page C4.

TYPICAL OPERATION

Frequency	9.0	9.0	9.0	Gc's
Heater voltage (running)	4.8	0	0	V
Pulse duration	0.1	1.0	3.4	μs
Pulse repetition frequency	3333	1000	324	p/s
Duty cycle	0.00033	0.001	0.0011	
Pulse current	14	14	14	A
Pulse voltage	13.5	13.5	13.5	kV
Pulse input power	190	190	190	kW
R.F. pulse output power	60	60	60	kW
Mean input current	4.7	14	15.4	mA
Mean input power	63	190	210	W
Mean r.f. output power	20	60	65	W
Frequency pulling (v.s.w.r. > 1.5)	10	10	10	Mc s

OPERATING NOTES

The valve is provided with four magnetic shunts. (See outline drawings, pages D3 and D4.) From examination of the performance charts the number required for a particular application may be determined. To remove shunts which are not required, grip the tabs firmly with suitable pliers and pull away from the valve.

COOLING

A flow of cooling air must be directed between the radiator fins, and on to cathode and heater seals, in order to keep the temperature below the permitted maximum.

ABSOLUTE MAXIMUM RATINGS

Minimum warm up time	2.5	min

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 2.5 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 4 minutes.

For mean input powers greater than 0 watts, it is necessary to reduce the heater voltage immediately after the application of h.t. in accordance with the input power - heater voltage rating chart on page C1.

MOUNTING POSITION

Any

PRESSURISING

See operating notes

PHYSICAL DATA

Weight of magnetron	5.9kg	13lb
---------------------	-------	------

COOLING

Temperatures

Anode block	max.	150	°C
Cathode and heater seals	max.	165	°C

An adequate air flow should be forced through the cooling ducts on the magnetron to keep the anode block temperature below 150°C under any condition of operation. The heater-cathode terminal should also be sufficiently cooled to keep its temperature below 165°C.

OPERATING NOTES

Input pressurization min. 0.82kg/cm^2 (11.6lb/in^2) absolute.

Output pressurization max. 3.2kg/cm^2 (45lb/in^2) absolute

The output assembly must always be pressurized. When the magnetron is not working into a matched load, the pressure on the window must be higher than 1.0kg/cm^2 (14.2lb/in^2) absolute.

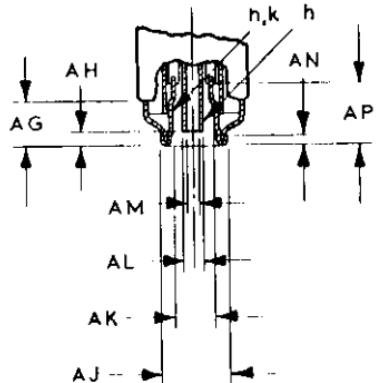

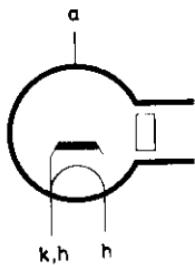

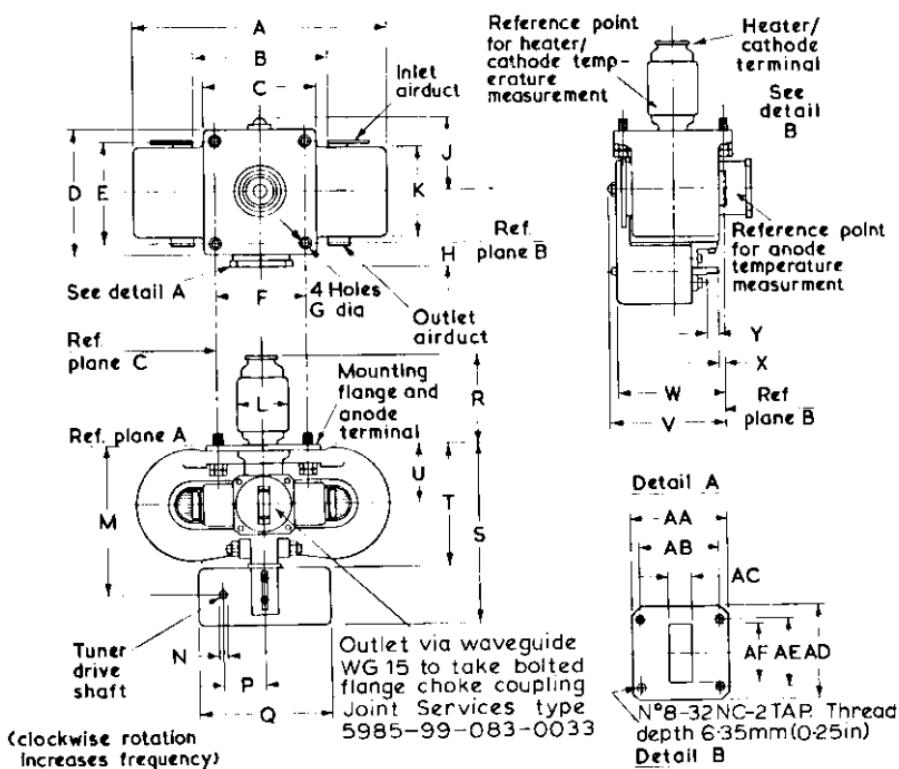

TUNING MECHANISM

The frequency of the magnetron decreases with clockwise rotation of the tuner drive shaft, as viewed directly towards the waveguide flange. (See page D4.)

A digital indicator provides a visual indication of the magnetron frequency. A number of frequencies and the corresponding indicator settings are indicated on the wall of the tuner box.

Axial stress on the tuner mechanism should be avoided. The tuner shaft should therefore be driven by a flexible coupling. The torque on the shaft must never exceed 13.8kg cm (1.0ft lb). Adjustment of the tuning mechanism beyond the stated frequency limits must not be attempted. The starting torque required to operate the tuner shaft is max. 1.5kg cm (0.108ft lb). The tuner drive should be capable of supplying 2.3kg cm (0.166ft lb).

QUICK REFERENCE DATA

Rugged magnetron with low frequency temperature coefficient, suitable for high altitude operation.

Frequency (Mechanically tunable) 5.65 Gc/s

Power output (pulsed) 120 W

Construction Packaged, coaxial output

To be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES.

CHARACTERISTICS

	Min.	Max.	
Frequency			
Tunable over the range	5.4	5.9	Gc/s
Pulse voltage (1 pulse = 0.8 A)	1.00	1.35	kV
R. F. pulse power output (1 pulse = 0.8 A)	70	-	W
Frequency pulling (v.s.w.r. = 1.5)	-	12	Mc/s
Frequency temperature coefficient	-	-0.1	per °C
Frequency modulation under vibration of 12g (50-2000c/s)	-	2.0	Mc/s
Input capacitance	-	6.0	pF
Frequency pushing	-	15	Mc/s per A

TYPICAL OPERATION

R. F. pulse power output	160	W
Duty factor	0.002	
Pulse duration	1.0	μs
Pulse repetition frequency	2000	p. p. s.
Heater voltage (running)	5.0	V
Pulse current	0.8	A
Pulse voltage	1.2	kV
Pulse input power	944	W
Rate of rise of voltage pulse	6.0	kV/μs
Mean input current	1.6	mA
Mean input power	1.9	W
Mean r. f. output power	320	mW
Frequency pulling (v.s.w.r. = 1.5)	10	Mc/s

CATHODE

Indirectly heated

V _h	5.0	V
I _h	0.5	A

Heating time. At ambient temperatures above 0 °C the cathode must be heated for at least 0.5 minutes before the application of h.t.

ABSOLUTE MAXIMUM RATINGS

	Min.	Max.	
Pulse current	0.6	1.0	A
Pulse duration	-	3.0	μs
Duty factor	-	0.002	
Mean input power	-	2.5	W
Rate of rise of voltage pulse	-	8.0	kV/μs
Load mismatch (v.s.w.r.)	-	1.5	
Temperature of anode block	-	100	°C

MOUNTING POSITION

Any

PHYSICAL DATA

	lb	kg
Weight of magnetron	0.45	0.2
Weight of magnetron in carton	9.0	4.1
Dimensions of storage carton	12.5 x 11.5 x 11.0	318 x 292 x 279

COOLING

In normal circumstances natural cooling is adequate but where the ambient temperature is abnormally high, or where convection cooling is restricted, provision for conduction cooling may be made by a clamp, of non-magnetic material, around the body.

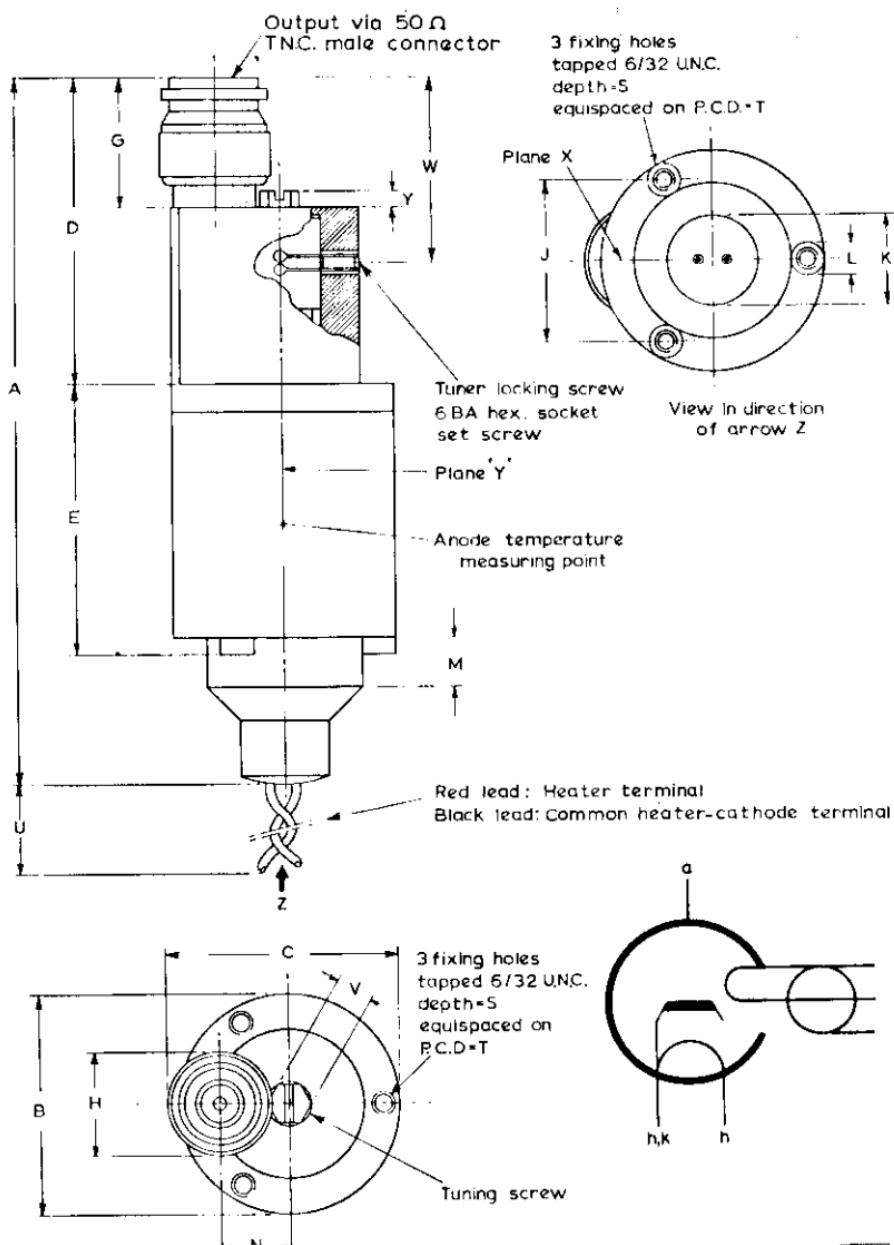

OUTPUT CONNECTION

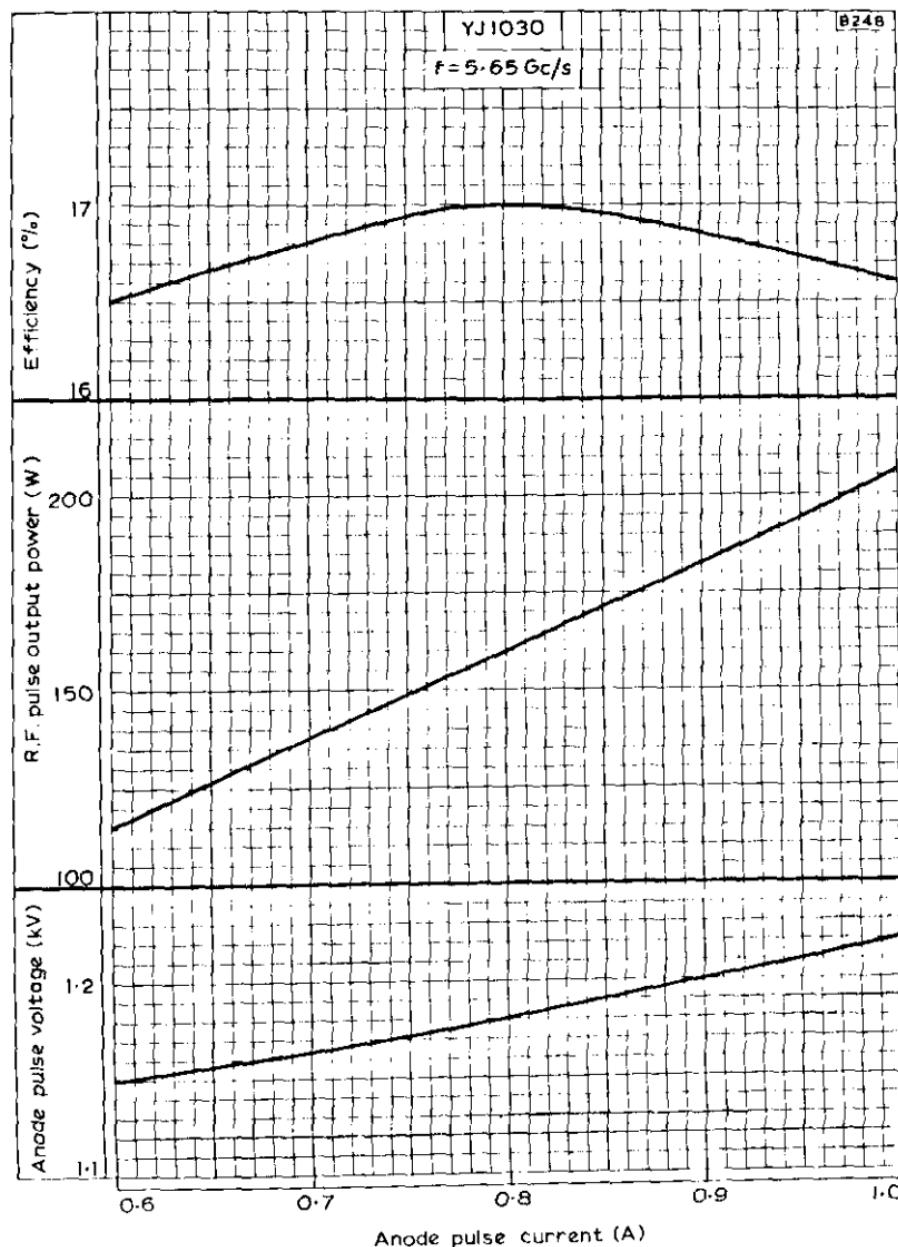

Output via 50Ω T.N.C. Male Connector

DIMENSIONS

ANODE PULSE VOLTAGE, R.F. PULSE OUTPUT POWER AND EFFICIENCY
PLOTTED AGAINST ANODE PULSE CURRENT

TENTATIVE DATA

QUICK REFERENCE DATA

Fixed frequency 'X' band pulsed magnetron.
Suitable for high altitude operation.

Frequency	9,375	Gc/s
Power output (pulsed)	14	kW

To be read in conjunction with
GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES

CHARACTERISTICS

	Min.	Max.	
Frequency			
Fixed within the band	9,345	9,405	Gc/s
Pulse voltage ($I_{pulse} = 5.75A$)	5.9	6.3	kV
R.F. pulse power output ($I_{pulse} = 5.75A$)	12.5	-	kW
Frequency pulling (v.s.w.r. = 1,2)	-	15	Mc/s
Frequency temperature coefficient	-	-0.25	Mc/s per deg C
Input capacitance	-	8.0	pF

TYPICAL OPERATION

R.F. pulse power output	14	kW
Duty factor	0.001	
Pulse duration	2.5	μs
Pulse repetition frequency	100	p.p.s.
Heater voltage (running)	6.3	V
Pulse current	5.75	A
Pulse voltage	6.1	kV
Pulse input power	35	kW
Rate of rise of voltage pulse	70	kV/μs
Mean input current	5.75	mA
Mean input power	5.6	W
Mean R.F. output power	2.24	W
Frequency pulling (v.s.w.r. = 1.2)	12	Mc/s

CATHODE

Indirectly heated

V _h	6.3	V
I _h	0.5 to 0.6	A
f _h	400	c/s

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 1.5 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 2.0 minutes.

ABSOLUTE MAXIMUM RATINGS

	Min.	Max.	
Pulse current	5.0	6.5	A
Pulse duration	-	2.5	μs
Duty factor		0.0015	
Mean input power		60	W
Rate of rise of voltage pulse		80	kV/μs
Load mismatch (v.s.w.r.)		1.2	
Temperature of anode block		120	°C

END OF LIFE PERFORMANCE

The valve is deemed to have reached end of life when it fails to satisfy the following:-

R. F. pulse power output (I _{pulse} = 5.75A)	10	kW
---	----	----

	Min.	Max.	
Frequency			
Within the band	9.345	9.405	Gc/s
Pulse voltage (I _{pulse} = 5.75A)	5.9	6.5	kV

MOUNTING POSITION	Any
-------------------	-----

PRESSURISING

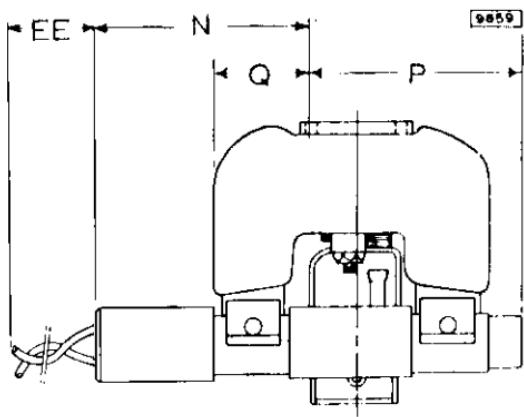

The valve is fitted with flying leads and the output waveguide is sealed with a vacuum tight window to allow operation at high altitude without pressurising. Operation to 60 000 ft can be achieved. The output window must not be pressurised.

PHYSICAL DATA

	lb	kg
Weight of magnetron	3.75	1.7

COOLING

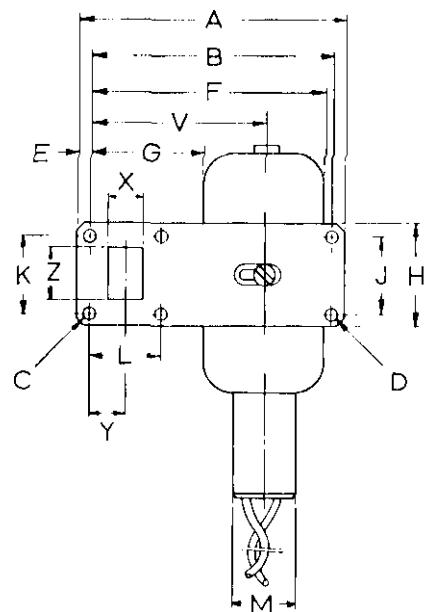

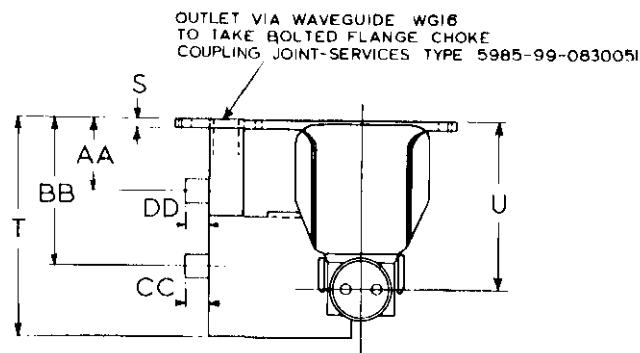

In normal circumstances natural cooling is adequate but where the ambient temperature is abnormally high, or convection cooling is restricted, artificial cooling may be necessary to keep the block temperature below the permitted maximum.

END OF LIFE PERFORMANCE

The valve is deemed to have reached end of life when it fails to satisfy the following:-

R.F. pulse power output ($I_{pulse} = 7.5A$)	16	kW	
Frequency fixed within the band	Min.	Max.	
Pulse voltage ($I_{pulse} = 7.5A$)	7.0	to	7.9 kV

MOUNTING POSITION Any

PRESSURISING

To meet the reduced atmospheric pressure during high altitude operation the output waveguide is sealed with a vacuum tight window. Operation up to 60000ft is offered provided a choke coupling is used but on no account is pressurisation of the output window permitted. A protective cover for the window is supplied.

*This includes pre-oscillation current.

CATHODE

Indirectly heated

V_h	6.3	V
I_h	0.55	A

Heating time

At ambient temperatures above 0°C the cathode must be heated for at least 2 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 3 minutes.

For mean input powers greater than 25 watts, it is necessary to reduce the heater voltage immediately after the application of h.t. in accordance with the input power-heater voltage rating chart on page C2.

RATINGS (ABSOLUTE MAXIMUM SYSTEM)

	Min.	Max.	
Pulse current	1.5	7.0	A
Pulse duration	-	1.0	μs
Duty factor	-	0.002	
Mean input power	-	85	W
Rate of rise of voltage pulse	-	120	kV/μs
Load mismatch (v.s.w.r.)	-	1.5	
Temperature of anode block	-	120	$^{\circ}\text{C}$

END OF LIFE PERFORMANCE

The valve is deemed to have reached end of life when it fails to satisfy the following:

R.F. pulse power output ($I_{pulse} = 6.0A$)	7.0	kW
	Min.	Max.
Frequency fixed within the band	9.38	to
Pulse voltage ($I_{pulse} = 6.0A$)	5.5	to
	6.0	kV

MOUNTING POSITION

Any

PHYSICAL DATA

	lb	kg
Weight of magnetron	3.0	1.4
Weight of magnetron in carton	5.7	2.5
	in	cm

Dimensions of storage carton 7.75 × 8.0 × 9.75 20 × 21 × 25

COOLING

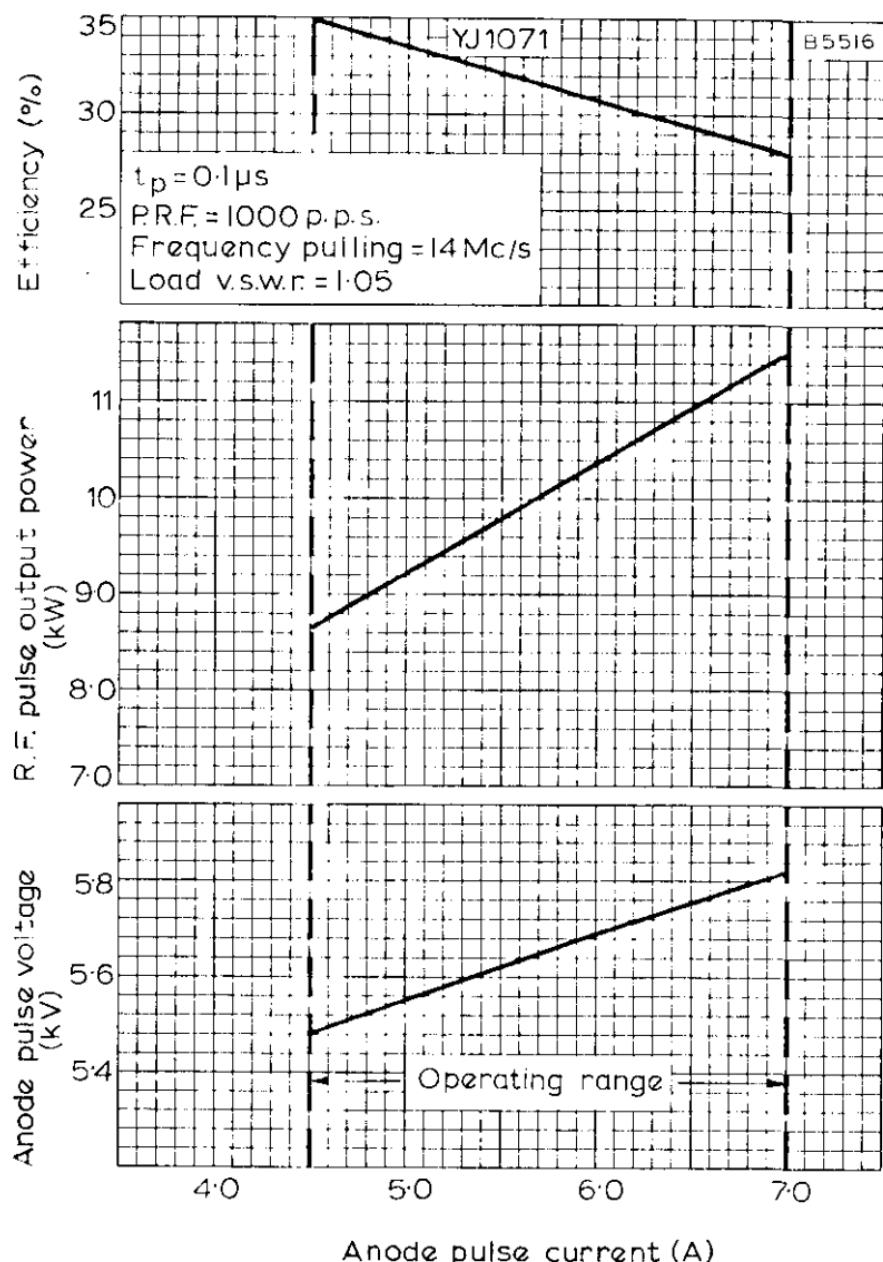

In normal circumstances natural cooling is adequate, but when the ambient temperature is abnormally high a flow of cooling air between the cooling fins may be necessary to keep the anode block temperature below the permitted maximum.

B4828

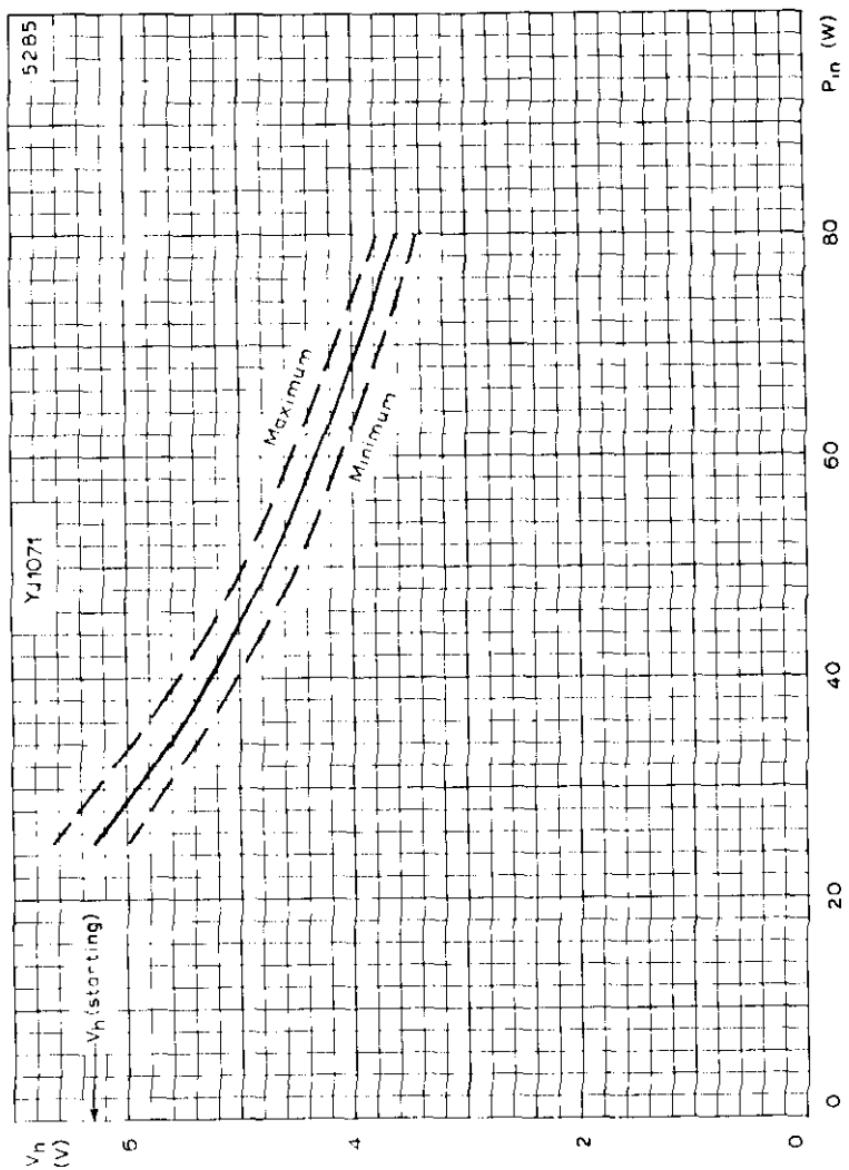

NOTES

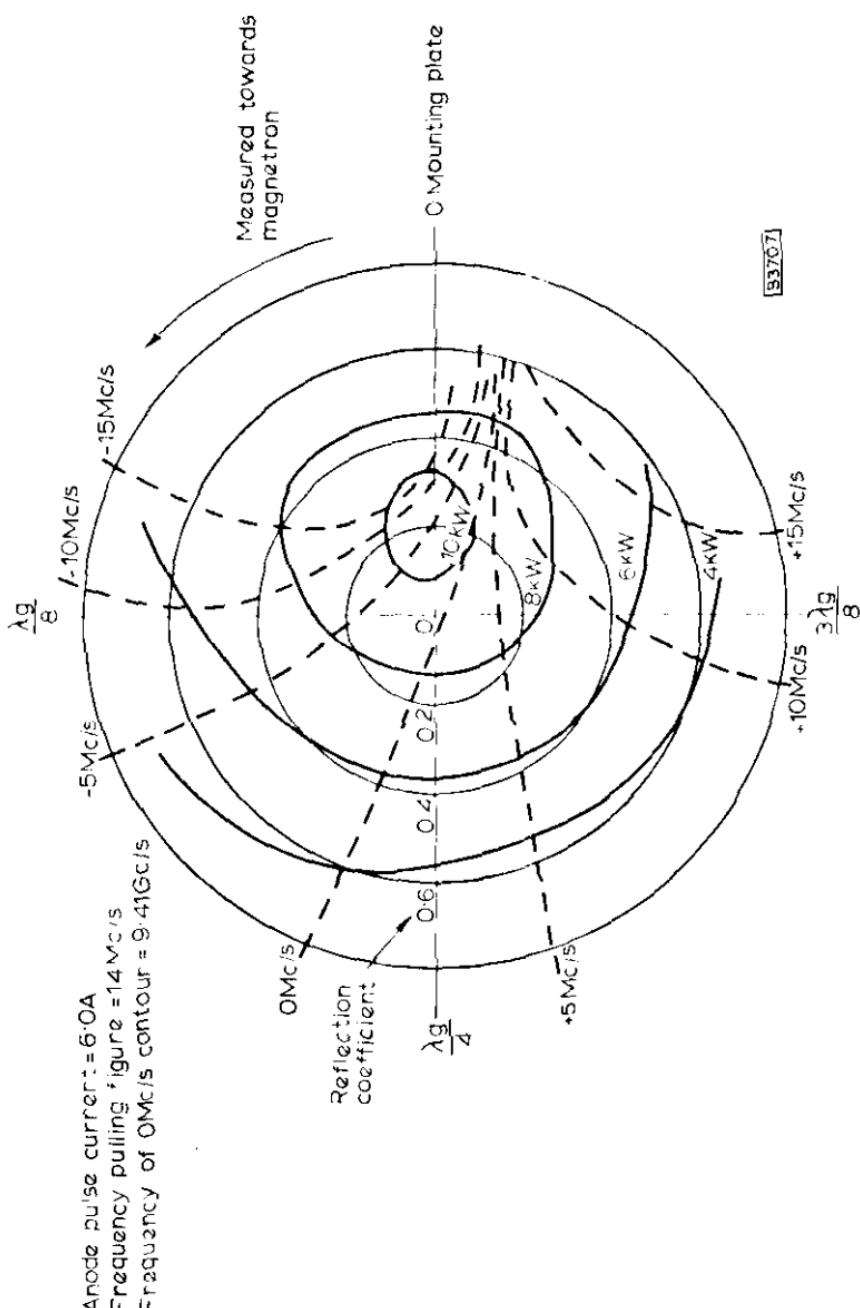

1. The protector sleeve shall be within 5° of a normal to reference plane C.
2. A cylinder 0.33in (8.38mm) diameter centred in the holes shown shall clear the side of the magnet.
3. The outlet via the waveguide WG16 is to take a bolted flange choke coupling, Joint Services type 5985-99-0830051.

TENTATIVE DATA

QUICK REFERENCE DATA

Mechanically tunable rugged magnetron with low frequency temperature coefficient, suitable for high altitude operation.

Frequency	YJ1100	9.0 to 9.5	Gc/s
	YJ1101	8.5 to 9.0	Gc/s
Power output (pulsed)		180	W

To be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES.

Unless otherwise shown data is applicable to both types.

CHARACTERISTICS

		Min.	Max.
Frequency	YJ1100	9.0	9.5 Gc/s
Tunable over the range	YJ1101	8.5	9.0 Gc/s
Pulse voltage ($I_{pulse} = 0.9$ A)		1,025	1,350 kV
R. F. pulse power output ($I_{pulse} = 0.9$ A)		150	- W
Frequency pulling (v.s.w.r. = 1.5)		-	15 Mc/s
Frequency temperature coefficient over the range T anode 60 to 100°C		-	0.1 Mc/s per °C
Frequency modulation under vibration of 12g (50-2000c/s)		-	3.0 Mc/s
Input capacitance			6.0 pF
Frequency pushing ($I_{pulse} = 0.9$ A)		-	25 kc/s per mA

TYPICAL OPERATION at $f = 9.25$ Gc/s (YJ1100) and $f = 8.75$ Gc/s (YJ1101)

R. F. pulse power output	180	W
Duty factor	0.002	
Pulse duration	1.0	μs
Pulse repetition frequency	2000	p.p.s.
Heater voltage (running)	5.0	V
Pulse current	0.9	A
Pulse voltage	1.18	kV
Pulse input power	1.06	kW
Rate of rise of voltage pulse	10	kV/μs
Mean input current	1.8	mA
Mean input power	2.12	W
Mean r.f. output power	0.36	W
Frequency pulling (v.s.w.r. = 1.5)	10	Mc/s
Frequency pushing	10	kc/s per mA

CATHODE

Indirectly heated

Vh 5.0 V
Ih 0.5 A

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 30 seconds before the application of h.t.

ABSOLUTE MAXIMUM RATINGS

	Min.	Max.	
Pulse current	0.7	1.1	A
Pulse duration	-	2.0	μs
Duty factor	-	0.004

TUNING

Tuning programme	16 full cycles per shaft revolution. One cycle consists of a quasi-sinusoidal scan through the entire tuning range and return.
Integral servo-motor	Navy Bu. Ord. Size 18 servo-motor N.A.T.O. number 6105-99-972-6555
Drive input	115V, 400Hz, fixed phase 115V, 400Hz, centre tapped control phase 9.2W/phase
Minimum drive speed	4000 r.p.m.

MOUNTING POSITION

Any

PRESSURISING

To prevent arcing the air pressure in the waveguide should not be less than 740 torr.

PHYSICAL DATA

	kg	lb
Weight of magnetron	6.8	15

COOLING

Forced-air cooling is required in order to keep the anode block temperature below the permitted maximum.

An air flow of approximately $0.85\text{m}^3/\text{min.}$ ($30\text{ft}^3/\text{min.}$) should be directed on the cooling fins.

Temperature

Anode block max.	120	$^{\circ}\text{C}$
------------------	-----	--------------------

OUTPUT CONNECTION

Suitable for connection to waveguide RG51/U (WG15, R84)

OPERATING NOTES

Tunable version with optional fixed frequency lock, YJ1181.

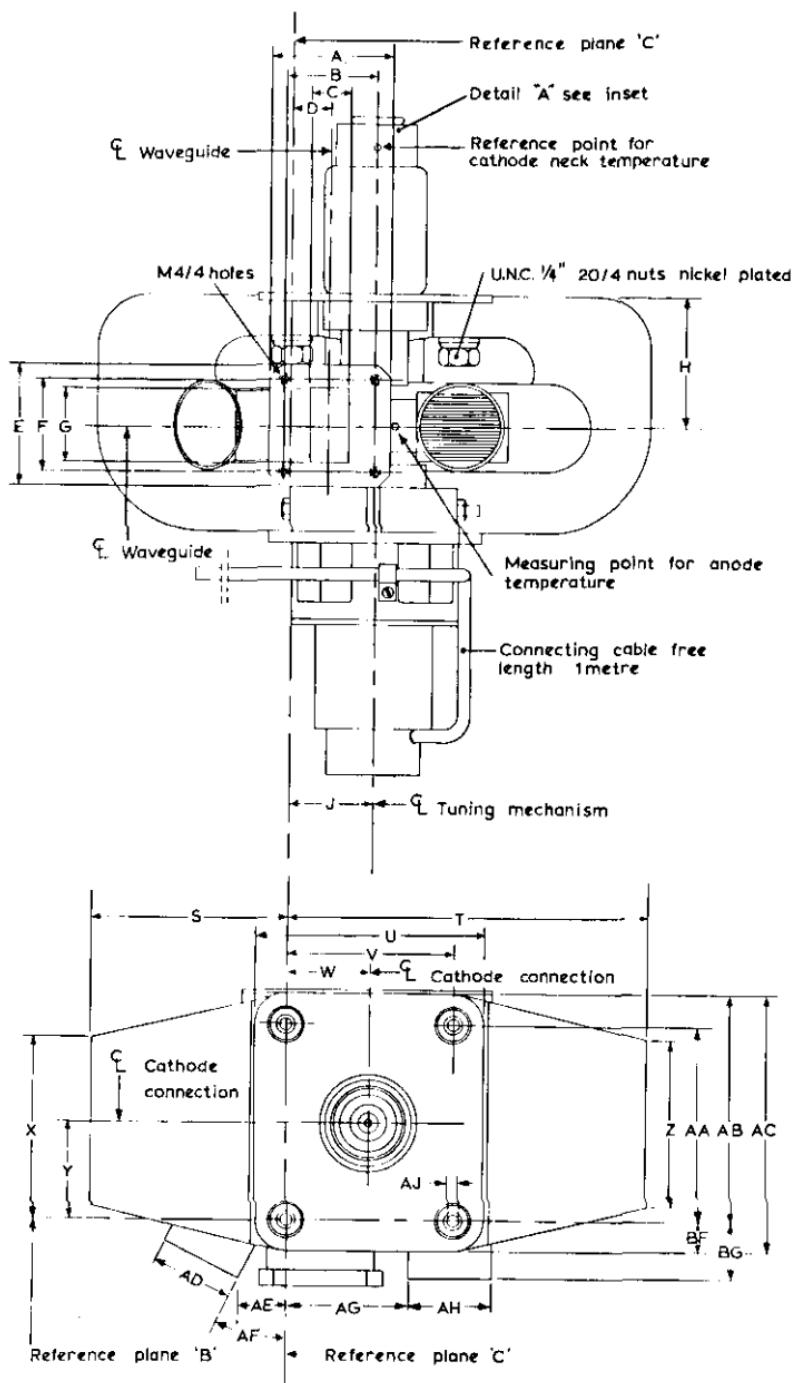

The lock consists of a small mechanical device mounted with the electrical connections to the two-phase, 400Hz drive motor.

It does not add to the volume or external dimensions of the magnetron as it is completely contained in the present housing for the motor cable connections. The only protruding part is the frequency adjustment screw, similar to those of conventional tunable magnetrons. The frequency trimming is made by means of a screw-driver or a flexible shaft to a knob for manual adjustment, or to a servo motor for remote monitoring. In the latter case the magnetron frequency may be kept as close as desired to a predetermined frequency by comparison with a resonant cavity in a closed servo loop.

The lock is actuated simply by reversing the phase order of the motor, thus letting the stalled torque work against a stop. The actuated lock keeps the tuner in a precisely defined angular position, corresponding to a predetermined frequency.

For a fixed operating point in steady state conditions the frequency can be locked to within 20MHz from any predetermined frequency within the tuning band without any adjustments, either manual or automatic. With the operating point varying within the specification, the frequency can still be kept within 35MHz. Under all conditions (transient or steady state) the locking frequency is kept within 60MHz from the predetermined frequency. See page D4.

MAGNETRON

YJ1200
YJ1201

TENTATIVE DATA

QUICK REFERENCE DATA

High altitude magnetrons for X-band operation. Output coupling to type YJ1200 is WG16, and to type YJ1201 is WG15.

Frequency	9.375	GHz
Power output	50	kW
Construction	Packaged with flying leads	

Unless otherwise shown, data is applicable to both types

To be read in conjunction with

GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES

OPERATING CONDITIONS

R. F. pulse power output	50	kW
Duty factor	0.0016	
Pulse duration	4.0	μs
Pulse repetition frequency	400	p.p.s.
Heater voltage (running)	7.7	V
Pulse current	12	A
Pulse voltage	12	kV
Pulse input power	144	kW
Rate of rise of voltage pulse	60	kV/μs
Mean input current	19.2	mA
Mean input power	230	W
Mean r.f. output power	80	W
Frequency pulling (v.s.w.r. = 1.3)	10	MHz

CATHODE

Indirectly heated

V_h	12.4	V
I_h	2.2 to 0.2	A
$I_{h(\text{surge})}$ max. starting	10	A

The cathode must be heated for at least 90 seconds before the application of h.t.

CHARACTERISTICS

	Min.	Max.	
Frequency fixed within the band	9.345	9.405	GHz
Pulse voltage ($I_{pulse} = 12A$)	11	12.5	kV
R.F. pulse power output ($I_{pulse} = 12A$)	40	-	kW
Frequency pulling (v.s.w.r. = 1.3)	-	15	MHz
Frequency temperature coefficient	-	-0.25	MHz/degC
Frequency pushing	-	0.5	MHz/A

RATINGS (ABSOLUTE MAXIMUM SYSTEM)

	Min.	Max.	
Pulse current	8.0	14	A
Pulse duration	-	5.0	μs
Duty factor	-	0.0025	
Mean input power	-	350	W
Rate of rise of voltage pulse	-	80	kV/μs
Load mismatch (v.s.w.r.)	-	1.5	

END OF LIFE PERFORMANCE

The magnetron is deemed to have reached end of life when it fails to satisfy the following:-

R.F. pulse power output ($I_{pulse} = 12A$)	35	kW
Frequency fixed within the band	9.345	GHz
Pulse voltage ($I_{pulse} = 12A$)	11	kV

MOUNTING POSITION

Any

COOLING

Temperatures

Anode block max.	120	°C
Cathode and heater seals max.	150	°C

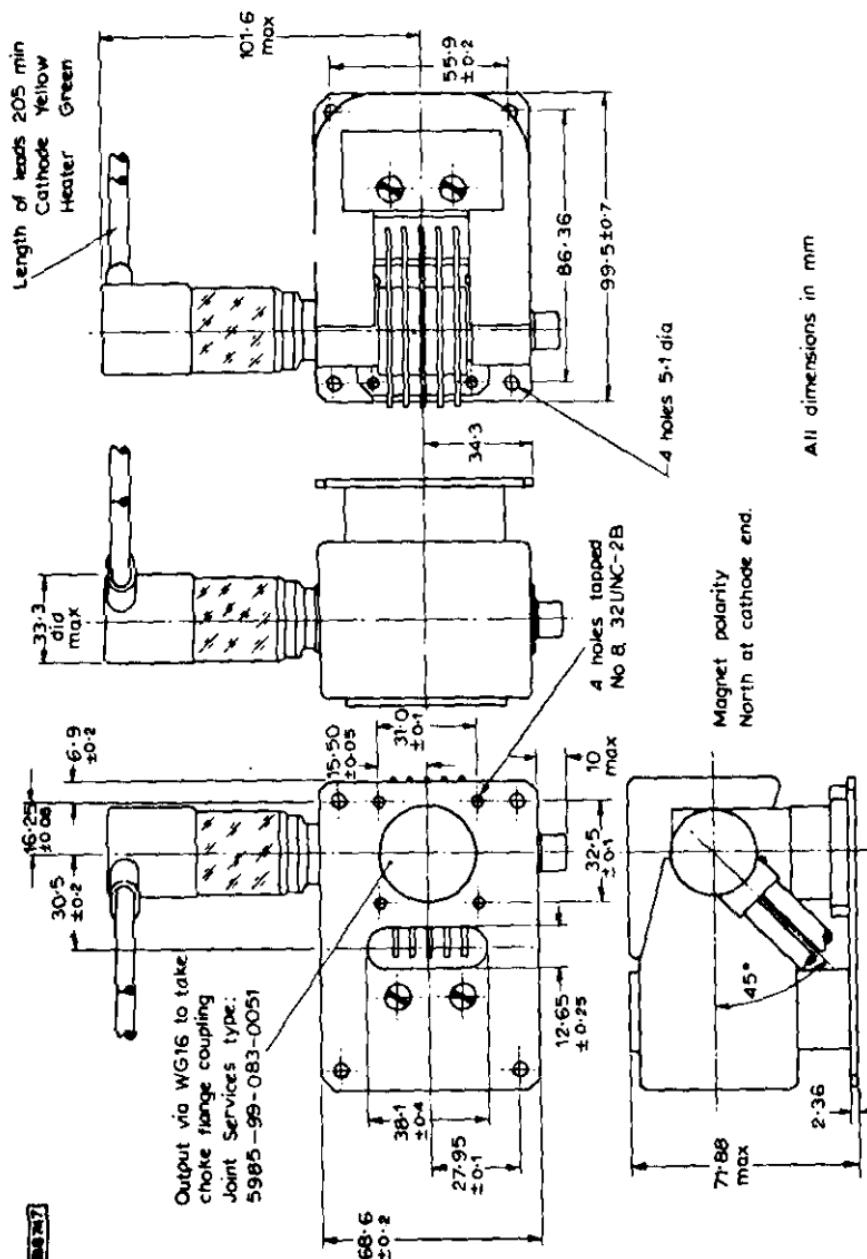

PRESSURISING

The magnetron is capable of unpressurised operation at altitudes up to 30 000ft for the YJ1200 and 40 000ft for the YJ1201.

PHYSICAL DATA

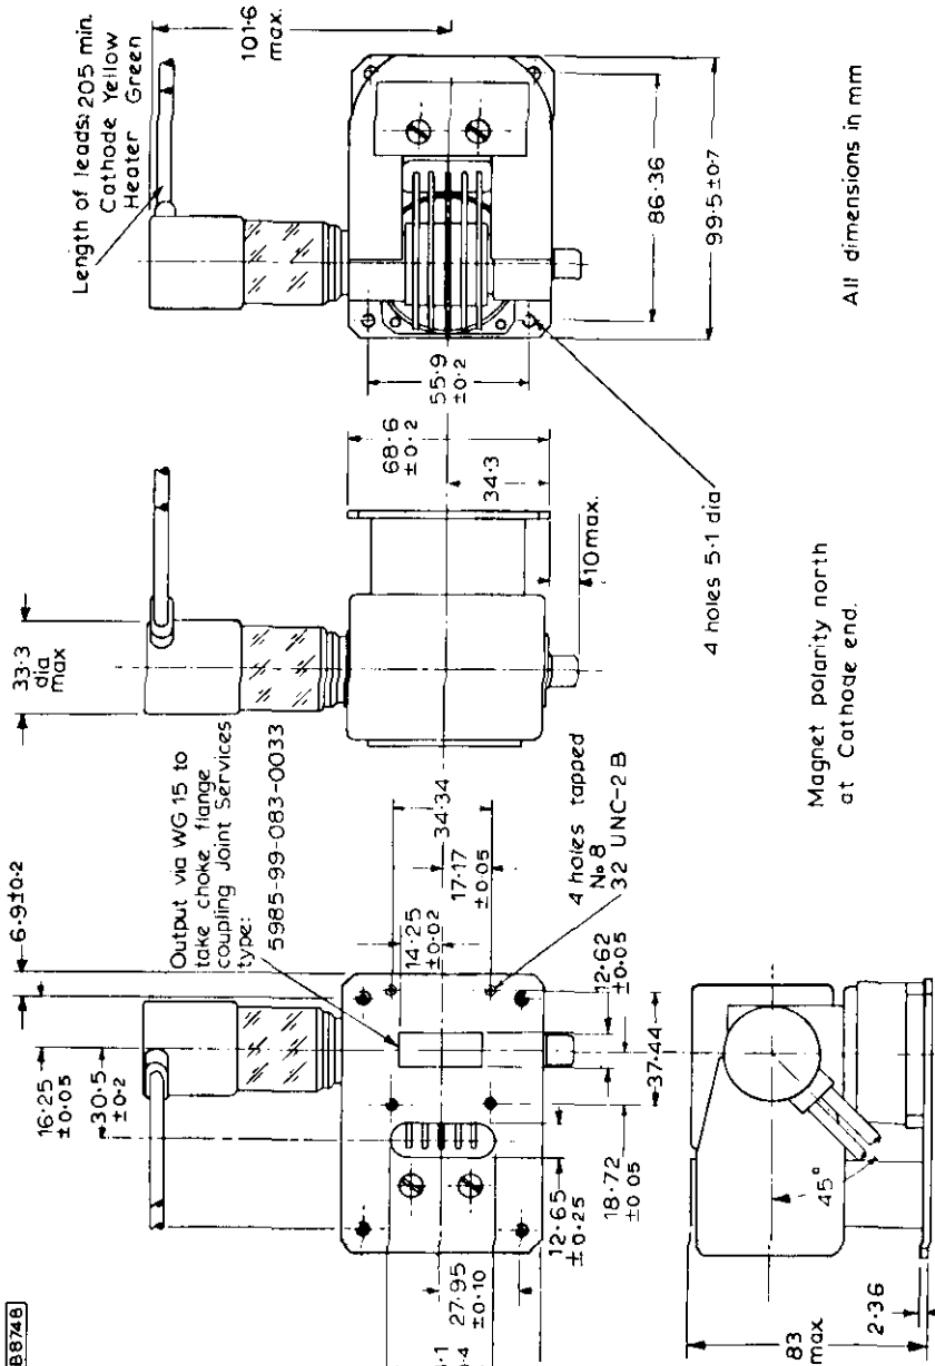

Weight of magnetron	1.9	kg

Rate of rise of voltage pulse	-	90	kV/μs
Load mismatch (v.s.w.r.)	-	1.5	

END OF LIFE PERFORMANCE

The magnetron is deemed to have reached end of life when it fails to satisfy the following:-

R.F. Pulse power output ($I_{pulse} = 17.5A$)	75	kW	
	Min.	Max.	
Frequency fixed within the band	9.315	9.375	GHz
Pulse voltage ($I_{pulse} = 17.5A$)	14	17	kV

MOUNTING POSITION

Any

PHYSICAL DATA

Weight of magnetron	1.9	kg
---------------------	-----	----

COOLING

Temperatures

Anode block max.	120	°C
Cathode and heater seals max.	150	°C

PRESSURISING

The cathode stem bushing will not arc over at a reduced atmospheric pressure equivalent to an altitude of 35 000ft. The output system will operate satisfactorily at a reduced atmospheric pressure equivalent to an altitude of 25 000ft with a load v.s.w.r. of 1.5:1 varied through all phases.

VIBRATION

The magnetron will operate normally when subjected to sinusoidal vibrations of amplitude +0.5mm or 1.5g whichever is the smaller in the frequency range 5 to 150Hz in any plane and the total frequency deviation shall not exceed 100kHz.

ACCELERATION

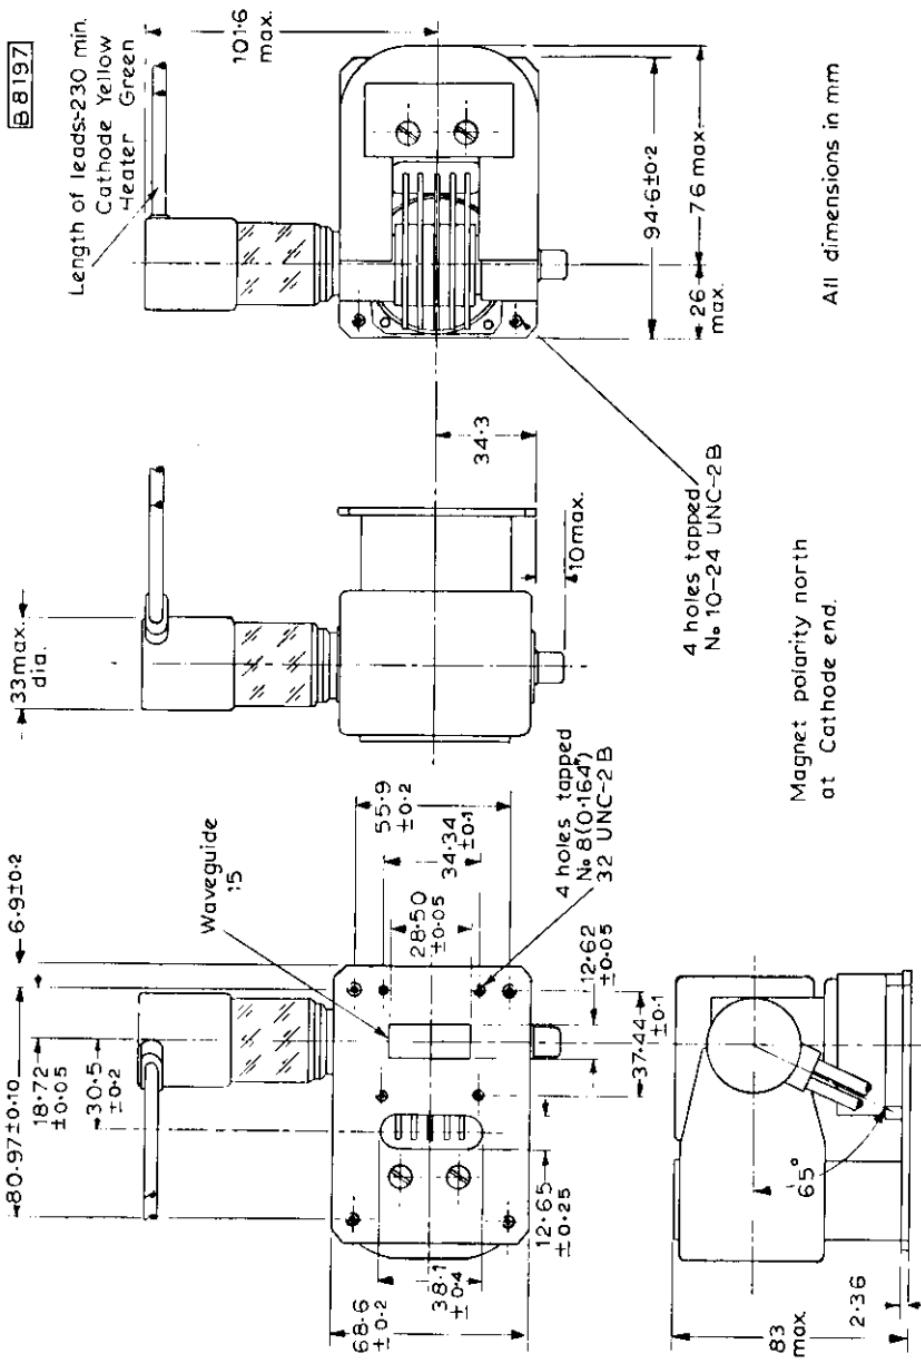

The magnetron will function normally when subjected to an acceleration of 5.5g in any plane. No part of the valve will break loose when subjected to an acceleration of 10g in any plane.

CLIMATIC

The magnetron will meet the requirements of the Joint Services Spec. K1001 issue 6 clauses 10.1, 10.3 and 10.8.

OUTLINE DRAWING OF YJ1250

TENTATIVE DATA

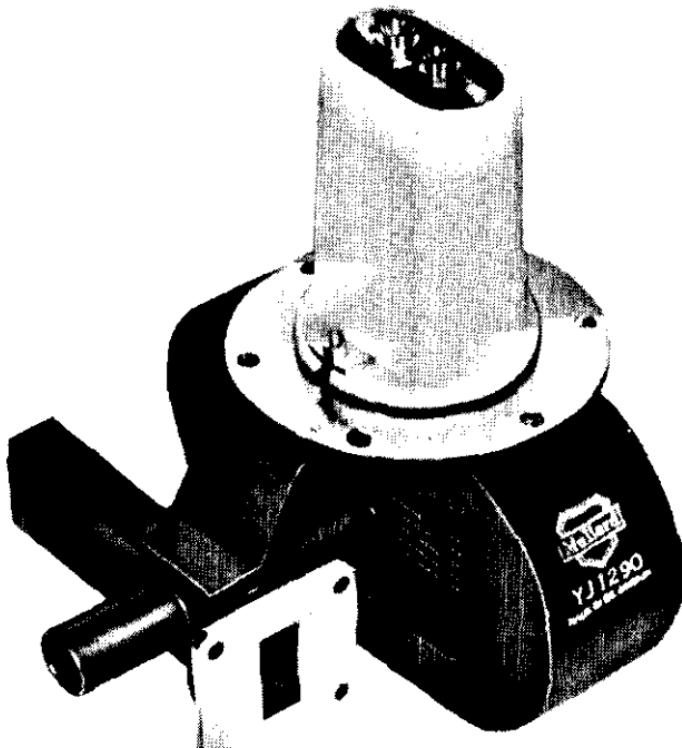

QUICK REFERENCE DATA

X-band, fixed frequency, pulsed magnetron

Frequency (fixed within the band)	9.415 to 9.475	GHz
Power output (peak)	65	kW
Construction	Packaged	
Output connection	Waveguide 16 flange	

To be read in conjunction with

GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES

TYPICAL OPERATION

Operating conditions

Heater voltage	1.0	V
Anode current (peak)	14	A
Pulse duration (t_p)	0.5	μs
Pulse repetition rate	1250	pulse/s
Rate of rise of voltage pulse	145	kV/μs

Typical performance

Anode voltage	14	kV
Power output (peak)	65	kW
Power output (mean)	40.5	W

CATHODE

Indirectly heated

Heater voltage (see notes 1 and 9)	6.3	V
Heater current	1.0	A
Heater current (surge) max.	5.0	A
Heating time min. (see note 2)	2.0	minutes

TEST CONDITIONS AND LIMITS

The magnetron is tested to comply with the following electrical specification:-

Test conditions

Heater voltage (for test)	0	V
Anode current (mean)	8.8	mA
Duty factor	0.00062	
Pulse duration (t_p) see note 3	0.5	μs
v.s.w.r. at output connection	1.05:1	
Rate of rise of voltage pulse (see note 4)	150	kV/μs

Limits and characteristics	Min.	Max.	
Anode voltage (peak)	12.5	15	kV
Power output (mean)	34	-	W
Frequency	9.415	9.475	GHz
R.F. Bandwidth at 1/4 power (see note 3)	-	2.5	tp
Frequency pulling (v.s.w.r. = 1.5:1)	-	15	MHz
Minor lobe level (v.s.w.r. = 1.5:1)	6.0	-	dB
Stability (see note 5)	-	0.25	%
Heater current (see note 6)			
Frequency temperature coefficient (see note 7)			

MAGNETRON

YJ1290

RATINGS (ABSOLUTE MAXIMUM SYSTEM)

These ratings cannot necessarily be used simultaneously and no individual rating should be exceeded.

	Min.	Max.	
Heater voltage	5.7	7.0	V
Anode voltage (peak)	-	16	kV
Anode current (peak)	12	16	A
Power input (mean)	-	160	W
Duty factor	-	0.001	
Pulse duration (t_p) (see note 3)	-	1.0	μs
Rate of rise of voltage pulse (see note 4)	100	150	kV/μs
Anode temperature (see note 8)	-	120	°C
v.s.w.r. at output connection	-	1.5:1	

END OF LIFE PERFORMANCE

The quality of all production is monitored by random selection of magnetrons which are then life tested under the stated test conditions. If the magnetron is to be operated under different conditions from those specified above, Mullard Ltd. should be consulted to verify that the life will not be affected. The magnetron is considered to have reached the end of life when it fails to meet the following limits when tested as specified on page 2.

	Min.	Max.	
Power output (peak)	50	-	kW
Frequency	9.415	9.475	GHz
R.F. bandwidth at 1/4 power	-	$\frac{3.5}{t_p}$	MHz
Stability	-	0.5	%

MOUNTING POSITION (see note 10)

Any

COOLING

Adequate cooling is provided at maximum mean input power by an airflow of $0.43\text{m}^3/\text{min}$ ($15\text{ft}^3/\text{min}$) at $T_{\text{amb}} = 55^\circ\text{C}$ and standard pressure from an orifice of 31.75mm (1.250in) diameter located at 6.35mm (0.250in) from the cooling fins.

PHYSICAL DATA

	kg	lb	
Weight of magnetron	2.1	4.6	
Weight of magnetron in storage carton	2.75	6.0	
Dimensions of storage carton	215.9 × 247.65 × 266.7 8.5 × 9.75 × 10.5		mm in.

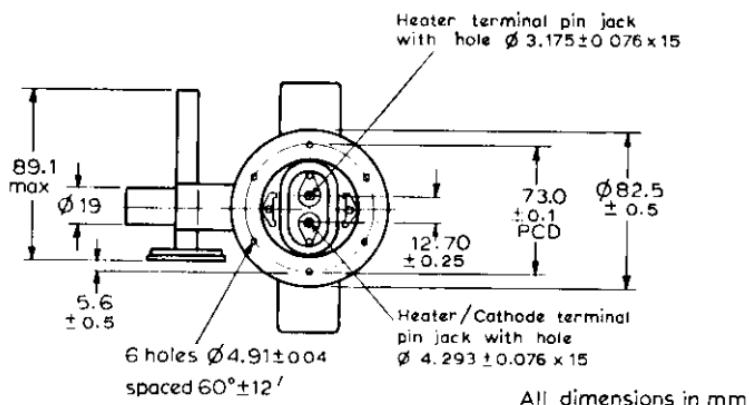

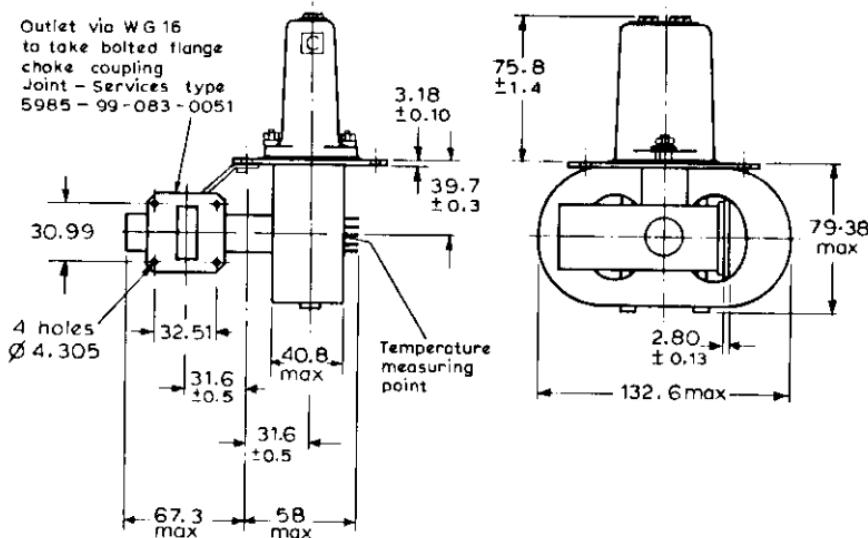

VIBRATION

The magnetron is vibration tested to ensure that it will withstand normal conditions of service.

NOTES

1. With no anode input power. The heater voltage during operation is very dependant on the application and should be agreed with Mullard Ltd.
2. For ambient temperatures above -15°C the cathode must be heated for at least 2 minutes before the application of H.T. For ambient temperatures between -15°C and -55°C the cathode heating time is 3 minutes minimum.
3. The tolerance of pulse current duration (t_p) measured at 50% amplitude is $\pm 10\%$.
4. Defined as the steepest tangent to the leading edge of the anode voltage pulse above 80% amplitude.
5. With the magnetron operating into a v.s.w.r. of 1.5:1 varied through all phases over the anode current range of 12A to 16A peak. Pulses are defined as missing when the r.f. energy level is <70% of the normal level in the frequency range 9.415GHz to 9.475GHz. Missing pulses are expressed as a percentage of the number of input pulses applied during the period of observation after a period of 3 minutes of operation.
6. Measured with a heater voltage of 6.3V and no anode input power, the heater current limits are 0.9 and 1.1A.
7. Design test only. The maximum frequency change with anode temperature change, after warming, is $-0.25\text{MHz}/\text{degC}$.
8. The anode temperature measured at the point indicated on the outline drawing must be kept below the limit specified.
9. The magnetron is normally tested with a heater supply of 50Hz and is suitable for operation at 1.1kHz. Mullard Ltd. should be consulted if the magnetron is to be operated with a heater supply of any other frequency.
10. It is necessary to keep all magnetic material as far as possible, at least 50mm (2in.) away from the magnet. The inner polystyrene pack of the magnetron carton provides adequate separation between magnetrons, and it is recommended that magnetrons not in use be kept in these packs.

PHYSICAL DATA

	kg	lb
Weight of magnetron	1.25	2.75
Weight of magnetron in storage carton	1.82	4.0
	mm	in
Dimensions of storage carton	190 × 190 × 280	7.5 × 7.5 × 11

VIBRATION

The magnetron is vibration tested to ensure that it will withstand normal conditions of service.

NOTES

- For ambient temperatures above 0°C the cathode must be heated for at least 30 seconds before the application of h.t. For ambient temperatures between 0°C and -55°C the cathode heating time is 45 seconds minimum.
- The tolerance of pulse current duration (tp) is $\pm 10\%$.
- Defined as the steepest tangent to the leading edge of the voltage pulse above 80% amplitude.
- Magnetrons with other frequency ranges can be supplied to order.
- With the magnetron operating into a v.s.w.r. of 1.5:1 varied through all phases over an anode current range of 4.0mA to 6.0mA. Pulses are defined as missing when the energy level is less than 70% of the normal level in the frequency range 9.380 to 9.440GHz. Missing pulses are expressed as a percentage of the number of input pulses applied during the period of observation after a period of 10 minutes operation.
- The cold impedance is measured at the operating frequency and will give a v.s.w.r. of >6:1. The position of voltage minimum from the face of the output flange into the magnetron shall be 3.0 to 9.0mm.

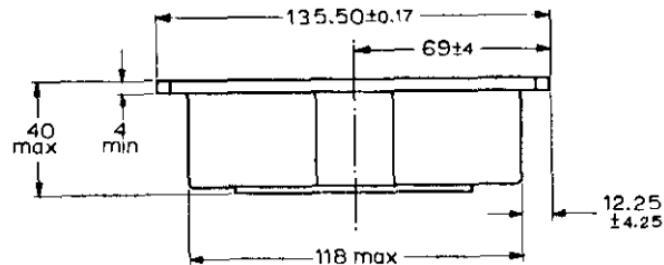

NOTES (contd.)

7. Measured with heater voltage of 6.3 volts and no anode input power, the heater current limits are 0.5 to 0.6A.
8. Design test only. The maximum frequency change with anode temperature change (after warming) is -0.25MHz/degC.
9. Design test only. The maximum input capacitance is 9.0pF.
10. The magnetron is normally tested with a heater supply of 50Hz and is suitable for operation at 1kHz. Mullard Ltd. should be consulted if the magnetron is to be operated with a heater supply of any other frequency.
11. It is necessary to keep all magnetic material as far as possible, at least 50mm (2in) from the magnet. The inner polystyrene pack of the magnetron carton provides adequate separation between magnetrons and it is recommended that magnetrons not in use be kept in these packs.

MAGNETRON

2J42

(MIL-E-1/667E)

QUICK REFERENCE DATA

Fixed frequency 'X' band magnetron with natural or forced-air cooling.

Frequency	9,345 to 9,405	Gc/s
Power output (pulsed)	7.5	kW

To be read in conjunction with GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES.

CHARACTERISTICS

	Min.	Max.	
Frequency			
Fixed within the band	9.345	9.405	Gc/s
Pulse voltage ($I_{pulse} = 4.5A$)	5.3	5.7	kV
R. F. pulse power output ($I_{pulse} = 4.5A$)	7.0	-	kW
Frequency pulling (v.s.w.r. = 1.5)	-	15	Mc/s
Frequency temperature coefficient	-	0.25	Mc/s per °C
Distance of v.s.w. minimum from face of mounting plate into valve	13.5	22.5	mm
Input capacitance	-	8.0	pF

TYPICAL OPERATION

R. F. pulse power output	7.5	kW
Duty factor	0.001	
Pulse duration	1.0	μs
Pulse repetition frequency	1000	p. p. s.
Heater voltage (running)	6.3	V
Pulse current	4.5	A
Pulse voltage	5.5	kV
Pulse input power	24.7	kW
Rate of rise of voltage pulse	50	kV/μs
Mean input current	4.5	mA
Mean input power	24.7	W
Mean r.f. output power	7.5	W
Frequency pulling (v.s.w.r. = 1.5)	14	Mc/s

CATHODE

Indirectly heated

V _h	6.3	V
I _h	600	mA

Heating time. At ambient temperatures above 0°C the cathode must be heated for at least 2 minutes before the application of h.t. Below this temperature the heating time must be increased to at least 3 minutes.

For mean input powers greater than 25 watts, it is necessary to reduce the heater voltage within 3 seconds of applying h.t. in accordance with the formula:

$$V_h = 6.3 \left(1 - \frac{P_{in}}{180}\right) \text{ Volts}$$

ABSOLUTE MAXIMUM RATINGS

	Min.	Max.
Pulse current	3.5	5.5 A
Pulse duration	2.5	μs
Duty factor	0.0025	
Mean input power	82.5	W
Rate of rise of voltage pulse	75	kV/μs
Load mismatch (v.s.w.r.)	1.5	
Temperature of anode block	120	°C

MOUNTING POSITION

Any

MAGNETRON

COOLING

In normal circumstances natural cooling is adequate, but where the ambient temperature is abnormally high, a flow of cooling air between the radiator fins may be necessary to keep the block temperature below the permitted maximum.

ANODE PULSE VOLTAGE, R.F. PULSE POWER OUTPUT AND EFFICIENCY PLOTTED AGAINST ANODE PULSE CURRENT

QUICK REFERENCE DATA

Fixed frequency 'X' band forced air cooled magnetron.

Frequency	9.375	GHz
Power output (pulsed)	50	kW
Construction	Packaged	

To be read in conjunction with

GENERAL OPERATIONAL RECOMMENDATIONS - MICROWAVE DEVICES

OPERATING CONDITIONS

R. F. pulse power output	50	50	kW
Duty factor	0.00067	0.001	
Pulse duration	2.0	1.0	μs
Pulse repetition frequency	325	1000	p.p.s.
Heater voltage (running)	2.5	0	V
Pulse current	12	12	A
Pulse voltage	12	12	kV
Pulse input power	144	144	kW
Rate of rise of voltage pulse	50	50	kV/μs
Mean input current	8.0	12	mA
Mean input power	96	144	W
Mean r.f. output power	32.5	50	W
Frequency pulling (v.s.w.r. = 1.5)	12	12	MHz

CATHODE

Indirectly heated

V_h	$6.3 \pm 10\%$	V
I_h	1.0	A
I_h (surge) max.	6.0	A
t_{h-k} (min.)	120	s

It is necessary to reduce the heater voltage immediately after the application of h.t. in accordance with the input power-heater voltage rating chart on page C1.

CHARACTERISTICS	Min.	Max.	
Frequency (fixed within the band)	9.345	9.405	GHz
Pulse voltage ($I_{pulse} = 12A$)	4.0	13.0	kV
R.F. pulse power output ($I_{pulse} = 12A$)	40	-	kW
Frequency pulling (v.s.w.r.=1.5)	-	15.0	MHz
Frequency temperature coefficient	-	0.25	MHz per degC

RATINGS (ABSOLUTE MAXIMUM SYSTEM)

	Max.	
Pulse current	16	A
Pulse duration	2.5	μ s
Duty factor	0.001	
Mean input power	180	W
Rate of rise of voltage pulse	60	kV/ μ s
Load mismatch (v.s.w.r.)	1.5	

END OF LIFE PERFORMANCE

The valve is deemed to have reached end of life when it fails to satisfy the following:

R.F. pulse power output ($I_{pulse} = 12A$)	30	kW
Frequency	Min.	Max.
Within the band	9.345	to 9.405

BANDWIDTH	<u>3.0</u> tp	MHz
-----------	------------------	-----

Where tp = Pulse duration in μ s

MOUNTING POSITION	Any
-------------------	-----

PRESSURISING

The magnetron need not be pressurized at heights up to 10,000ft.

The circular mounting flange and the waveguide output system of the valve are made to enable the magnetron to be used in applications requiring a pressure seal.

They can be maintained at a pressure of 3.17kg/cm^2 (45lb/in^2) absolute.

PHYSICAL DATA

	kg	lb
Weight of magnetron	1.7	3.7
Weight of magnetron in carton	4.5	9.9

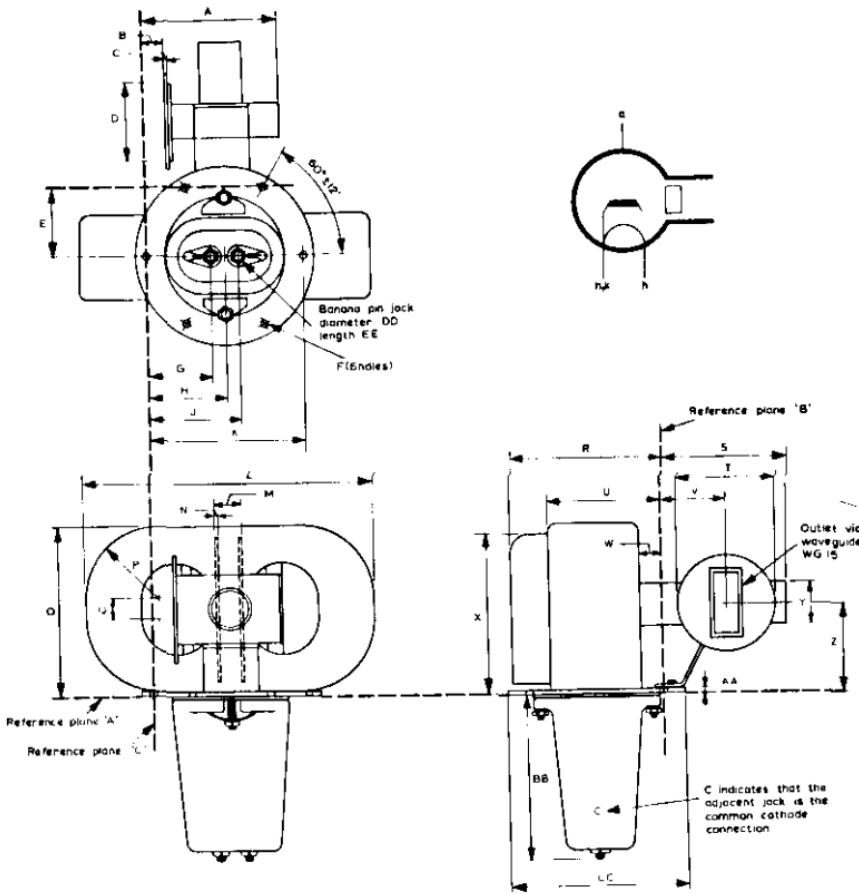

COOLING

A flow of cooling air may be necessary to keep the anode block temperature below the permitted maximum.

Temperature

Anode block max.	100	$^{\circ}\text{C}$
