### N O T E S

- The cathode current given here is that current at which the response of the cathode current ceases to be a linear function of the light intensity because of cathode resistance. In general, the cathode current must be kept well below this value in order to satisfy the maximum ratings of the anode current.
- Averaged over a 30 second interval maximum.
- Supply voltage between cathode and first dynode should be 2 times supply voltage between succeeding dynodes.
